

ITC 5104 DATABASE DESIGN AND SQL

Lecture 7

Chapter 10 Oracle 12c SQL

Selected Single-Row Functions

OBJECTIVES

- Use the UPPER, LOWER, and INITCAP functions to change the case of field values and character strings
- Manipulate character substrings with the SUBSTR and INSTR functions
- Determine the length of a character string using the LENGTH function
- Use the LPAD and RPAD functions to pad a string to a certain width
- Use the LTRIM and RTRIM functions to remove specific character strings
- Substitute character string values with the REPLACE
- Round and truncate numeric data, using the ROUND and TRUNC functions

OBJECTIVES

- Combine character strings with the `CONCAT` function
- Round and truncate numeric and date data with the `ROUND` and `TRUNC` functions
- Return only the remainder of a division operation with the `MOD` function
- Use the `ABS` function to set numeric values as positive
- Use the `POWER` function to raise a number to a specified power
- Manipulate date data with the `ADD_MONTHS`, `NEXT_DAY`, `LAST_DAY`, and `TO_DATE` functions
- Differentiate between the `CURRENT_DATE` and `SYSDTAE` functions
- Calculate the number of months between two dates using the `MONTHS_BETWEEN` function

OBJECTIVES

- Identify and correct problems associated with calculations involving NULL values using the NVL function
- Manipulate NULL values with the NVL2 function
- Display dates and numbers in a specific format using the TO_CHAR function
- Perform condition processing similar to an IF statement with the DECODE function and the CASE expression
- Convert string values to numeric with the TO_NUMBER function
- Use the DUAL table to test functions

A FUNCTION

- A **function** is a predefined block of code that accepts one or more arguments
- An **argument** is a value that is listed within parentheses
- A **function** returns a single value as output
- **Single-row functions** return one row of results for each record processed
- **Multiple-row functions** return only one result per group or category of rows processed, such as counting the number of books published by each publisher (Chapter 11)

FUNCTIONS

- Different categories of single-row functions:
 - Case conversion functions
 - Character manipulation functions
 - Numeric functions
 - Date functions
 - Other functions

CASE CONVERSION FUNCTIONS

- You can use character functions to change the case of characters, for example
 - Upper to lower
 - Lower to upper
- Used most of the time by developers, rarely by database administrators
- Case conversion functions alter the case of data stored in a field
- It is only temporary, it does not affect how data are stored, only how data are viewed during the execution of a query
- There are three functions supported by Oracle 12c for this purpose, LOWER, UPPER and INITCAP

CASE CONVERSION FUNCTIONS

- These are used to change the case of characters
- These alter the case of character strings
- They are used in a query to display data in a different case but they do not affect how the data is stored
- They can be used with an INSERT statement to set the case of a stored value
- There are the following functions:
 - LOWER
 - UPPER
 - INITCAP

LOWER FUNCTION

- When the **LOWER** function is used in the **SELECT** clause, it affects only how the data in the results will be displayed
- When the **LOWER** function is used in the **WHERE** clause, it is used for the specific comparison operation
 - Just Lee Books has data stored in upper case
 - LOWER(c), where (c) is the field or string to convert

LOWER FUNCTION

The screenshot shows a SQL Worksheet interface with a query editor and a results pane. The query editor contains the following SQL code:

```
1 SELECT firstname, lastname
2 FROM customers
3 WHERE LOWER(lastname) = 'nelson';
```

The results pane shows the output of the query, indicating that all rows were fetched in 0.188 seconds. The results are displayed in a table with two columns: FIRSTNAME and LASTNAME.

	FIRSTNAME	LASTNAME
1	BECCA	NELSON

LOWER FUNCTION

The screenshot shows an SQL Worksheet interface with a toolbar and a query editor. The query editor contains the following SQL code:

```
1 SELECT LOWER(firstname), LOWER(lastname)
2 FROM customers
3 WHERE LOWER(lastname) = 'nelson';
```

Below the query editor, the results are displayed in a table. The table has two columns: LOWER(FIRSTNAME) and LOWER(LASTNAME). The results show one row with the values 'becca' and 'nelson'.

	LOWER(FIRSTNAME)	LOWER(LASTNAME)
1	becca	nelson

UPPER FUNCTION

- This is another function used to make searches more “user friendly”
- The **UPPER** function converts the given string to *upper-case*
- The syntax is:
 - **UPPER(c)**
- Again, **(c)** is the character string to be converted to *upper-case*

UPPER FUNCTION

The screenshot shows a SQL IDE window with a query editor and a query result pane. The query editor contains the following SQL code:

```
1 SELECT firstname, lastname  
2 FROM customers  
3 WHERE lastname = UPPER('&lastname');
```

The query result pane shows the following output:

	FIRSTNAME	LASTNAME
1	BECCA	NELSON

A dialog box titled "Enter Substitution Variable" is open in the foreground. It contains the text "LASTNAME:" and a text input field with the value "nelson". The dialog has "OK" and "Cancel" buttons.

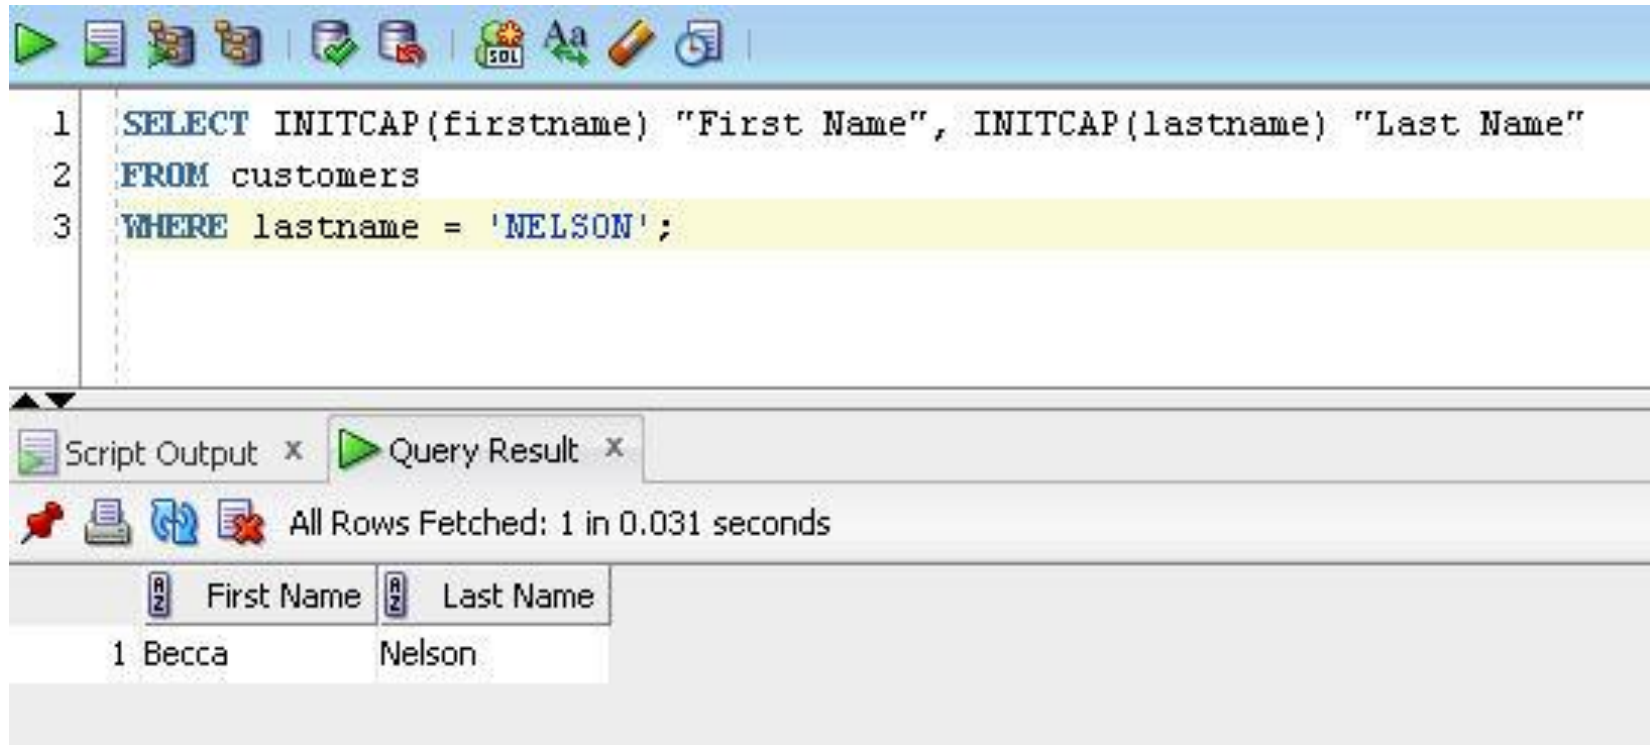

UPPER FUNCTION

- The **UPPER** function is included with the condition portion of the **WHERE** clause.
- It instructs Oracle 12c to convert the user-entered character string of 'nelson' to *upper-case* characters when the **SELECT** statement is executed
- It is more efficient to convert the search condition to the same case as the data stored in the table for the following reasons:
 - You don't need to worry whether the user knows the exact case to use when entering search strings
 - Oracle 12c does not need to convert the case of all the data contained within the field during execution of the query, thus reducing the processing burden placed on the Oracle server

INITCAP FUNCTION

- Having the table data and the search criteria in the same case enables you to find the records you seek. But, the output may not be presented in a very appealing way
- It is generally easier for people to read displayed data when it is presented in *mixed-case* letters rather than in all *upper-case* or all *lower-case* letters
- Oracle 12c uses the **INITCAP** function to convert character strings to mixed-case, placing a capital letter at the beginning of each word, and the balance of the word in *lower-case*
- Syntax is:
 - **INITCAP(c)**
- Where **(c)** is the string to be converted

INITCAP FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, undo, redo, and formatting. The main editor displays the following SQL query:

```
1 SELECT INITCAP(firstname) "First Name", INITCAP(lastname) "Last Name"  
2 FROM customers  
3 WHERE lastname = 'NELSON';
```

Below the editor, the "Query Result" tab is active, showing the execution status: "All Rows Fetched: 1 in 0.031 seconds". The results are displayed in a table with two columns: "First Name" and "Last Name".

	First Name	Last Name
1	Becca	Nelson

CHARACTER MANIPULATION FUNCTIONS

- There may be times when you need to manipulate a character string in order to yield the desired query output
- You may need to:
 - Know the length of a string
 - Extract portions of a string
 - Reposition a string
- These tasks are performed by using the **manipulation functions**

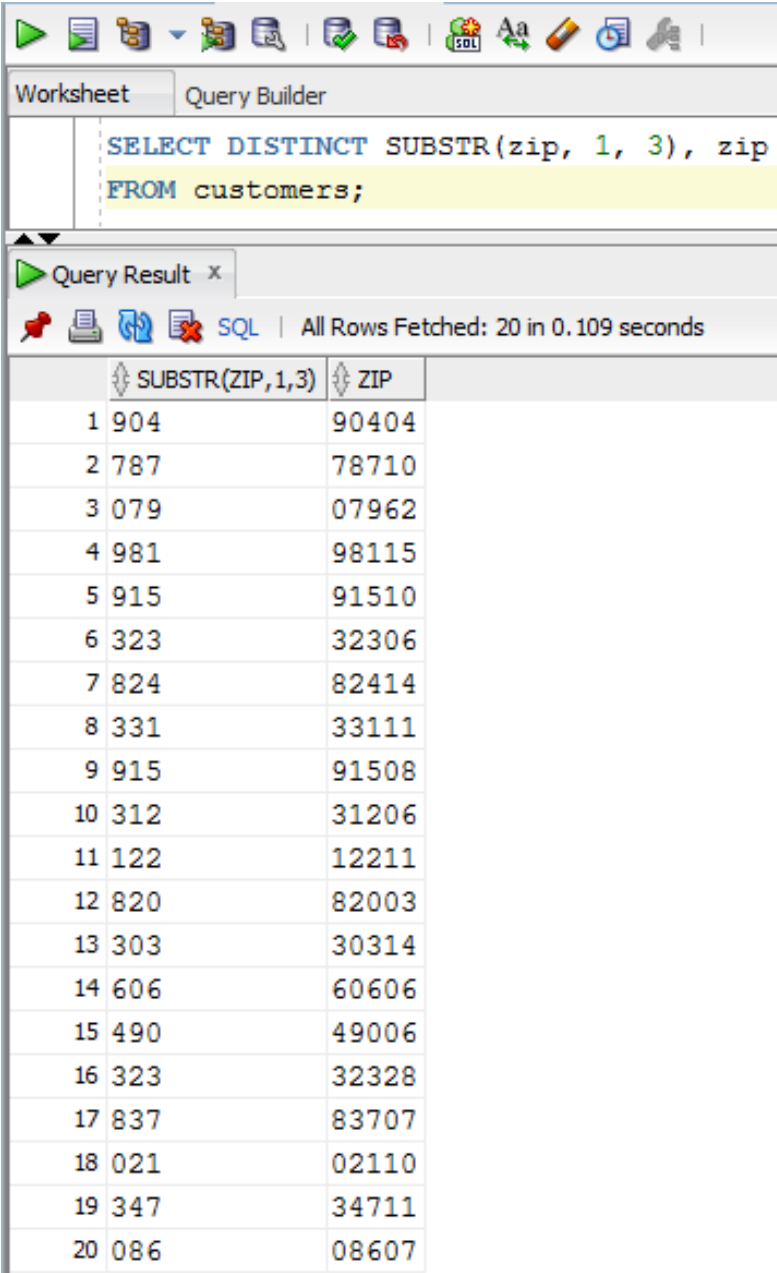

SUBSTR FUNCTION

- The **SUBSTR** function is used to return a *substring* or a portion of a string
- This is an excellent way to extract portions of a string that has been created on fields where a coding scheme has been implemented
- For example, in the American Zip Code, the first three numbers indicate a geographical distribution area within each state
- The **SUBSTR** function could be used to extract the first three digits of the zip code stored for each customer

SUBSTR FUNCTION

- The syntax for this function is:
 - **SUBSTR(c, p, l)**
 - Where **C** represents the character string
 - **P** represents the starting location for extraction (the first character is at position 1)
 - **L** represents the length of the string to return in the results
- The **DISTINCT** keyword is used to eliminate duplication
- On the next slide, the arguments (*zip, 1, 3*) instruct Oracle 12c to use the zip field starting with the first digit and to extract the first 3 characters and return them in the results

SUBSTR FUNCTION

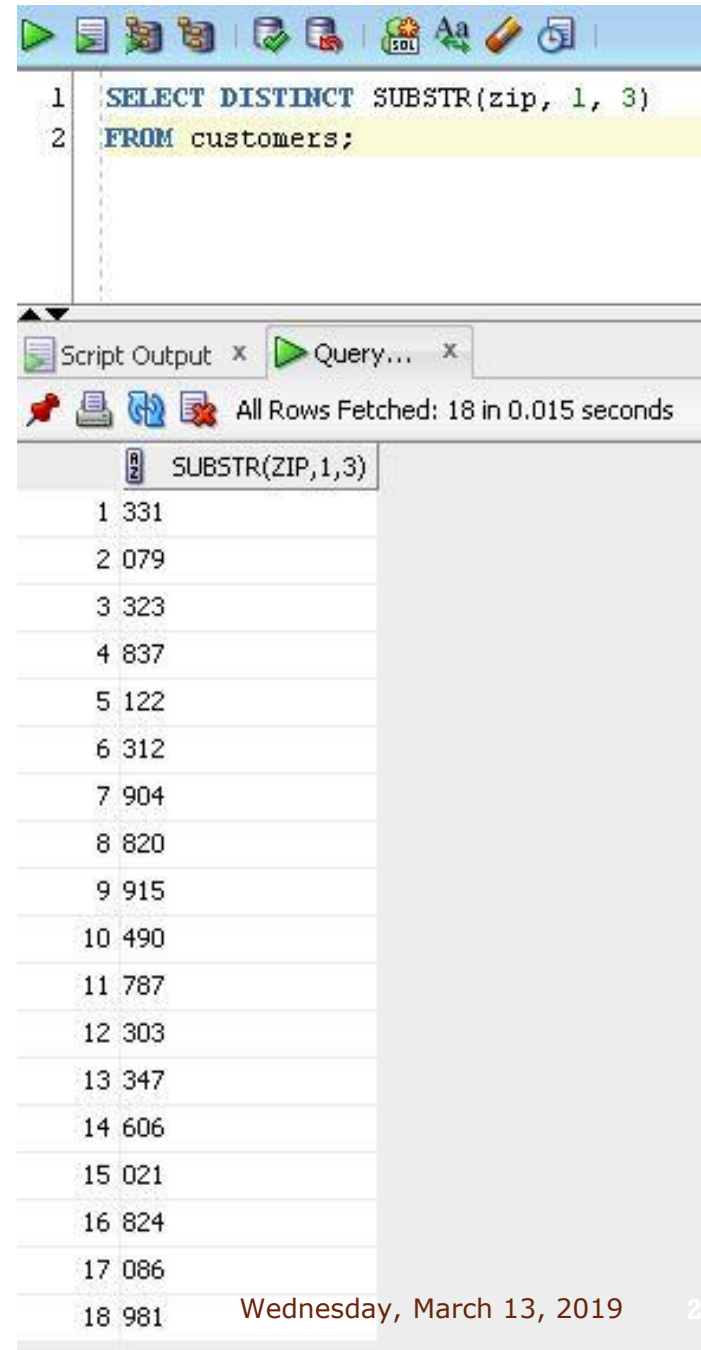

The screenshot shows a database query tool interface. At the top, there is a toolbar with various icons. Below the toolbar, there are two tabs: 'Worksheet' and 'Query Builder'. The 'Query Builder' tab is active, and it contains a SQL query: `SELECT DISTINCT SUBSTR(zip, 1, 3), zip FROM customers;`. Below the query, there is a 'Query Result' tab. The 'Query Result' tab shows the results of the query, which is a table with two columns: 'SUBSTR(ZIP,1,3)' and 'ZIP'. The table contains 20 rows of data, showing the first three digits of the zip code and the full zip code for each customer.

	SUBSTR(ZIP,1,3)	ZIP
1	904	90404
2	787	78710
3	079	07962
4	981	98115
5	915	91510
6	323	32306
7	824	82414
8	331	33111
9	915	91508
10	312	31206
11	122	12211
12	820	82003
13	303	30314
14	606	60606
15	490	49006
16	323	32328
17	837	83707
18	021	02110
19	347	34711
20	086	08607

SUBSTR FUNCTION

- The **SUBSTR** function can also be used to extract *substrings* from the **end** of the data stored in the field
- For example, if a negative 3 (-3) were used to indicate the starting position, the software would count backwards (from the end of the string) three positions, then extract the required number of characters
- Again, *column aliases* could be used to make the results more readable

SUBSTR FUNCTION

The screenshot displays a SQL development environment. The top pane shows a query using the SUBSTR function to extract the first three characters of the 'zip' column from a table named 'customers'. The bottom pane shows the results of the query, which are 18 distinct three-digit zip codes. The status bar indicates that all 18 rows were fetched in 0.015 seconds.

```
1 SELECT DISTINCT SUBSTR(zip, 1, 3)
2 FROM customers;
```

	SUBSTR(ZIP,1,3)
1	331
2	079
3	323
4	837
5	122
6	312
7	904
8	820
9	915
10	490
11	787
12	303
13	347
14	606
15	021
16	824
17	086
18	981

Script Output x Query... x

All Rows Fetched: 18 in 0.015 seconds

Wednesday, March 13, 2019

SUBSTR FUNCTION

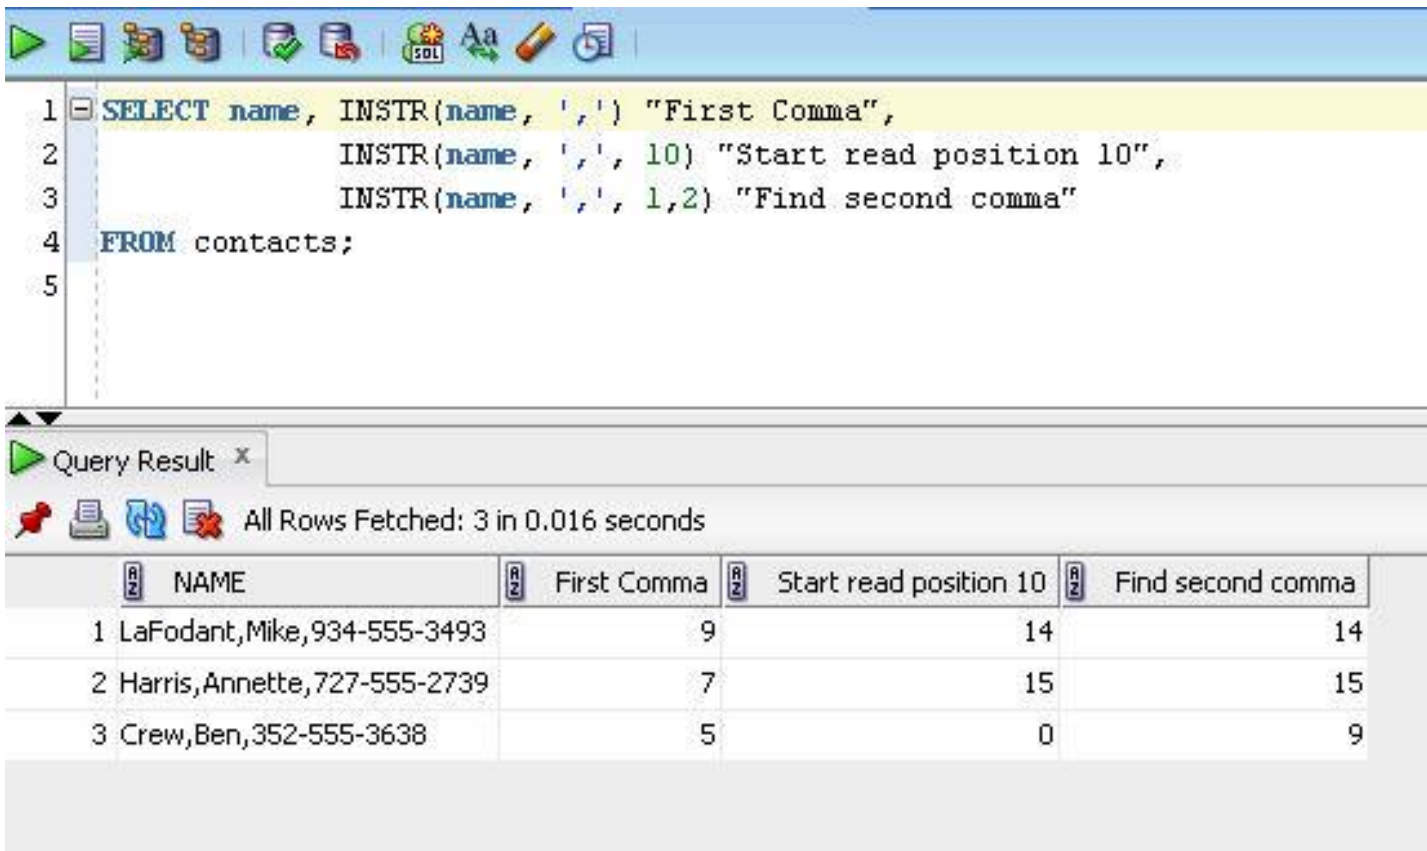

The screenshot shows a database query tool interface. At the top is a toolbar with various icons. Below it, the 'Query Builder' tab is active, displaying a SQL query in a text area. The query is: `SELECT DISTINCT SUBSTR(zip, 1, 3) "First Three", SUBSTR(zip, -3,2)"Digits 3 and 4", zip FROM customers;`. Below the query editor, the 'Query Result' tab is active, showing the results of the query. The results are displayed in a table with 10 rows and 4 columns: 'First Three', 'Digits 3 and 4', and 'ZIP'. The first column is an implicit row number. The data shows the first three digits and the last two digits of the ZIP codes for 10 different customers.

	First Three	Digits 3 and 4	ZIP
1	323	30	32306
2	837	70	83707
3	820	00	82003
4	079	96	07962
5	086	60	08607
6	981	11	98115
7	606	60	60606
8	347	71	34711
9	331	11	33111
10	303	31	30314

INSTR FUNCTION

- The INSTR function searches a string for a specified set of characters or a substring, then returns a numeric value representing the first character position in which the substring is found
- If the substring does not exist a 0 (zero) is returned
- Two arguments are provided to the INSTR function, the string that is to be searched, and the characters or substring enclosed in quotes to locate
- Two optional arguments are also available, the start position, indicating which character of the string value the search should begin with, and occurrence, which is the instance of the search value to locate, is it the first occurrence, or the second occurrence and so on
- By default it starts at the beginning of string value, and the beginning of the first occurrence is located

INSTR FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and editing. The main text area displays the following SQL query:

```
1 SELECT name, INSTR(name, ',') "First Comma",  
2         INSTR(name, ',', 10) "Start read position 10",  
3         INSTR(name, ',', 1, 2) "Find second comma"  
4 FROM contacts;  
5
```

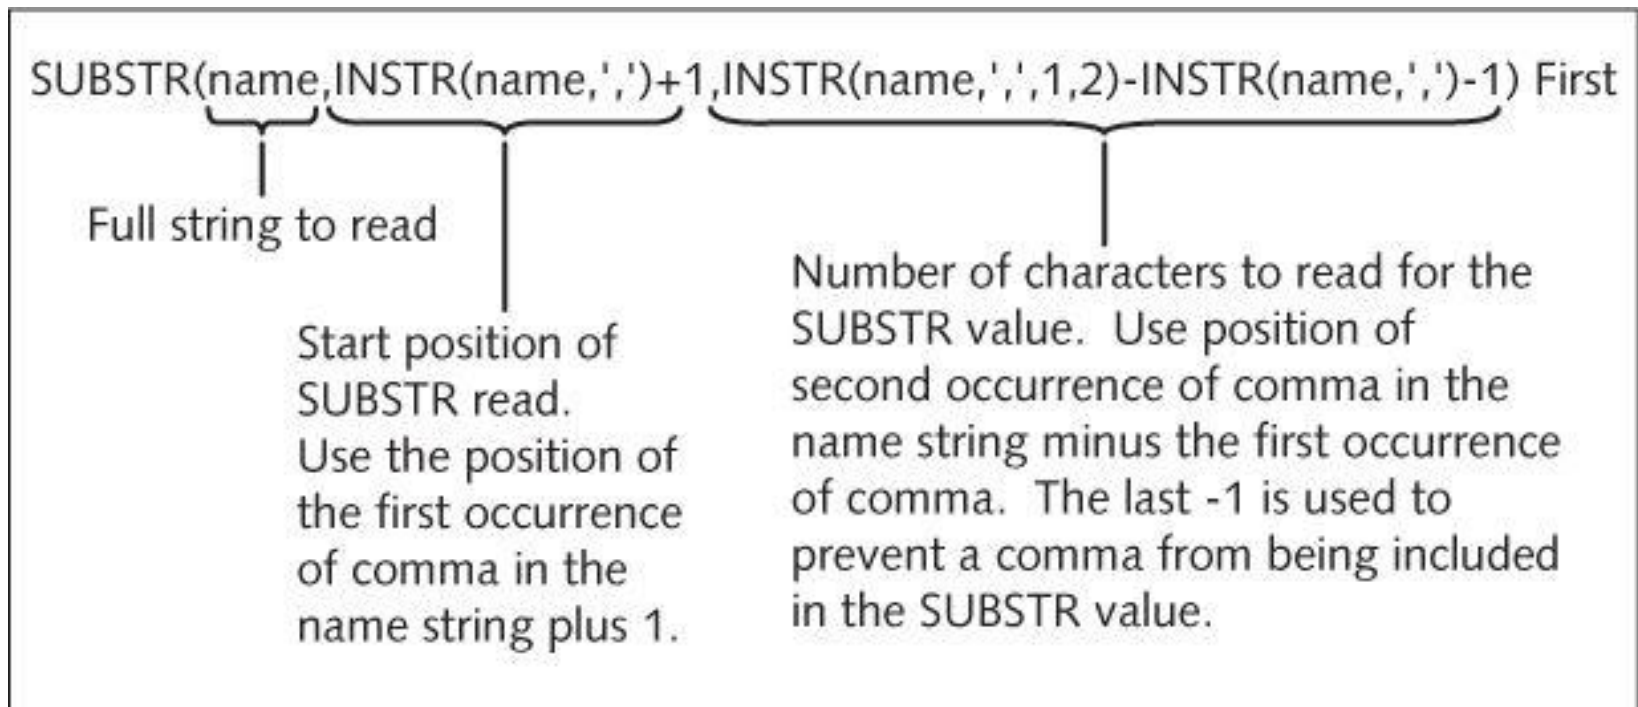

Below the query editor, the "Query Result" window is open, showing the results of the query. It indicates that all rows were fetched in 0.016 seconds. The results are displayed in a table with four columns: NAME, First Comma, Start read position 10, and Find second comma.

	NAME	First Comma	Start read position 10	Find second comma
1	LaFodant, Mike, 934-555-3493	9	14	14
2	Harris, Annette, 727-555-2739	7	15	15
3	Crew, Ben, 352-555-3638	5	0	9

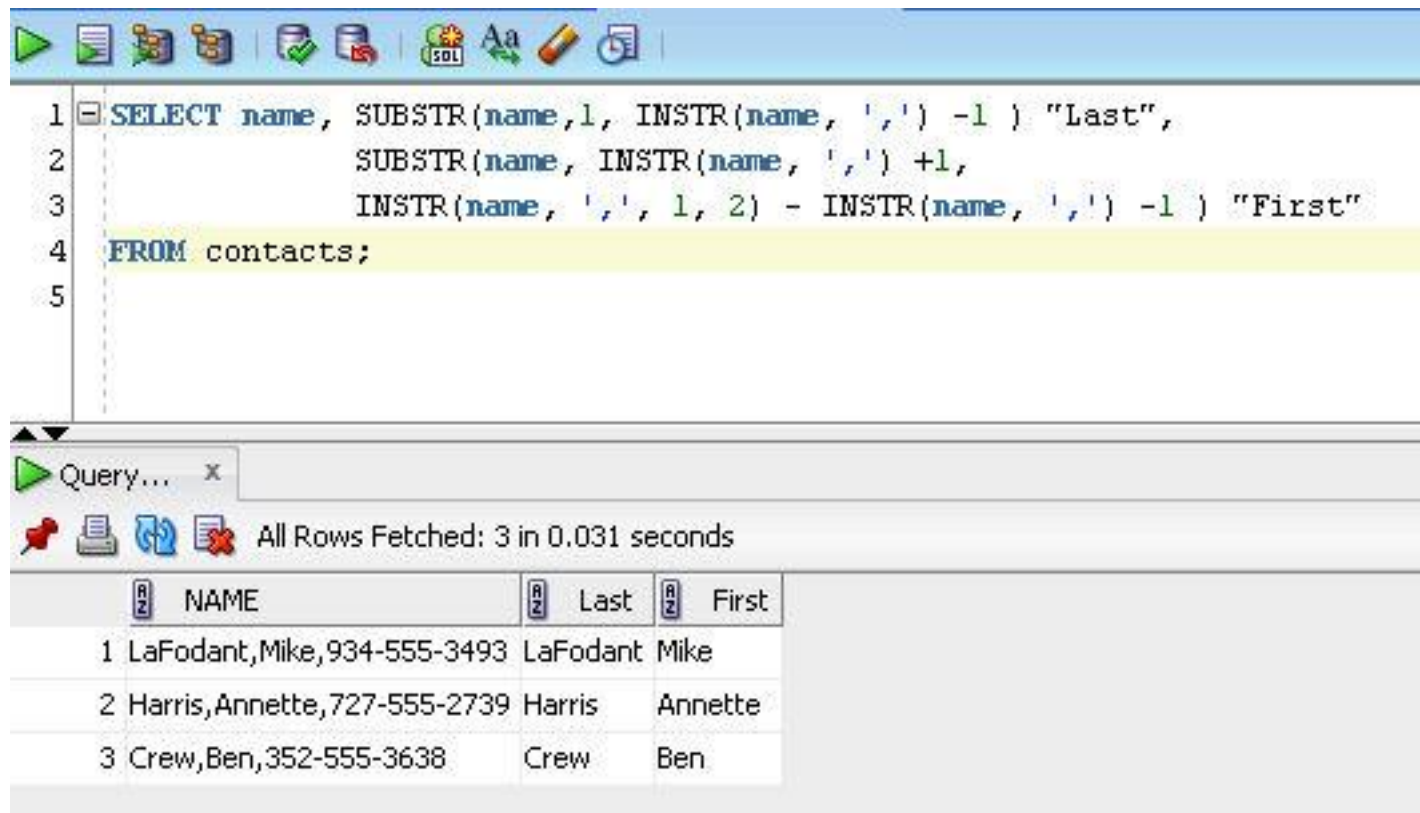

NESTED FUNCTIONS

- Any of the single-row functions can be nested inside other single-row functions
- When nesting functions you need to remember the following rules:
 - All arguments required for each function must be provided
 - For every opening parenthesis there must be a corresponding closing parenthesis
 - The nested or inner function is evaluated first, then the result of the inner function is passed to the outer function and then the outer function is executed
- See the nested function on slide 30, you may have to study it for awhile in order to figure out what is happening

INSTR NESTED INSIDE SUBSTR

INSTR NESTED INSIDE SUBSTR

The screenshot shows a SQL IDE interface. The top toolbar includes icons for running, saving, and editing queries. The main text area contains the following SQL query:

```
1 SELECT name, SUBSTR(name,1, INSTR(name, ',') -1 ) "Last",  
2         SUBSTR(name, INSTR(name, ',') +1,  
3         INSTR(name, ', ', 1, 2) - INSTR(name, ',') -1 ) "First"  
4 FROM contacts;  
5
```

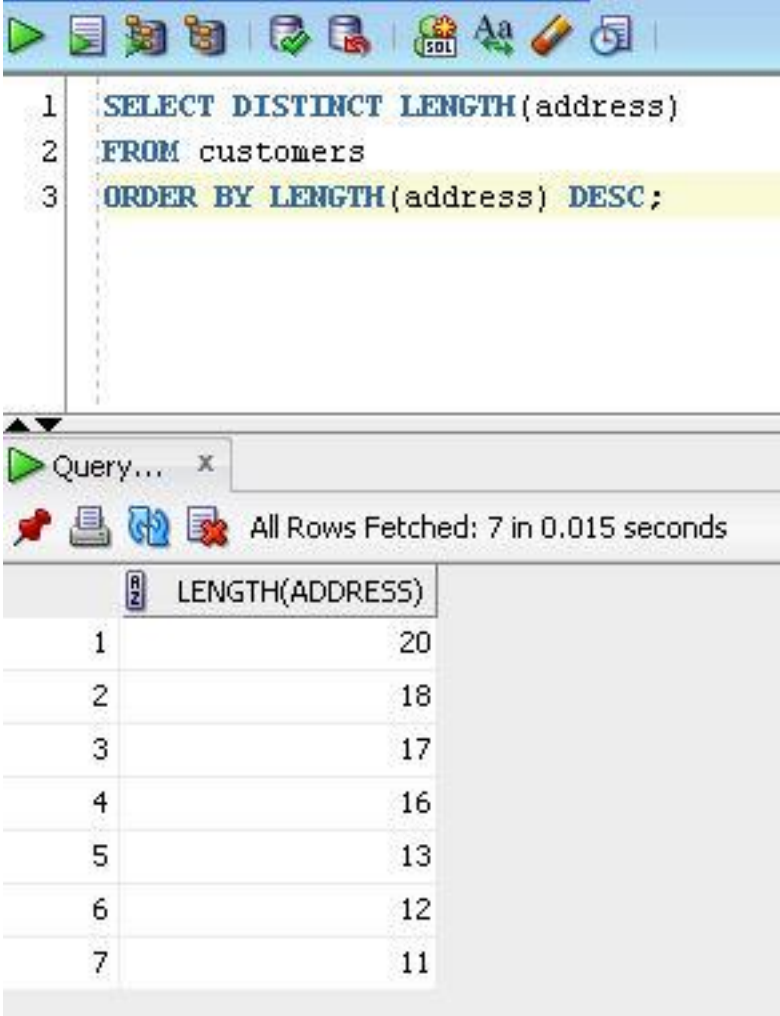

Below the query editor, a results pane titled "Query..." shows the execution status: "All Rows Fetched: 3 in 0.031 seconds". The results are displayed in a table with three columns: NAME, Last, and First.

	NAME	Last	First
1	LaFodant, Mike, 934-555-3493	LaFodant	Mike
2	Harris, Annette, 727-555-2739	Harris	Annette
3	Crew, Ben, 352-555-3638	Crew	Ben

LENGTH FUNCTION

- To determine the number of characters in a string, the **LENGTH** function is used
- The syntax of the **LENGTH** function is:
 - **LENGTH(c)**
 - Where (c) represents the character string whose length is to be determined

LENGTH FUNCTION

The screenshot shows a SQL query editor with the following code:

```
1 SELECT DISTINCT LENGTH(address)
2 FROM customers
3 ORDER BY LENGTH(address) DESC;
```

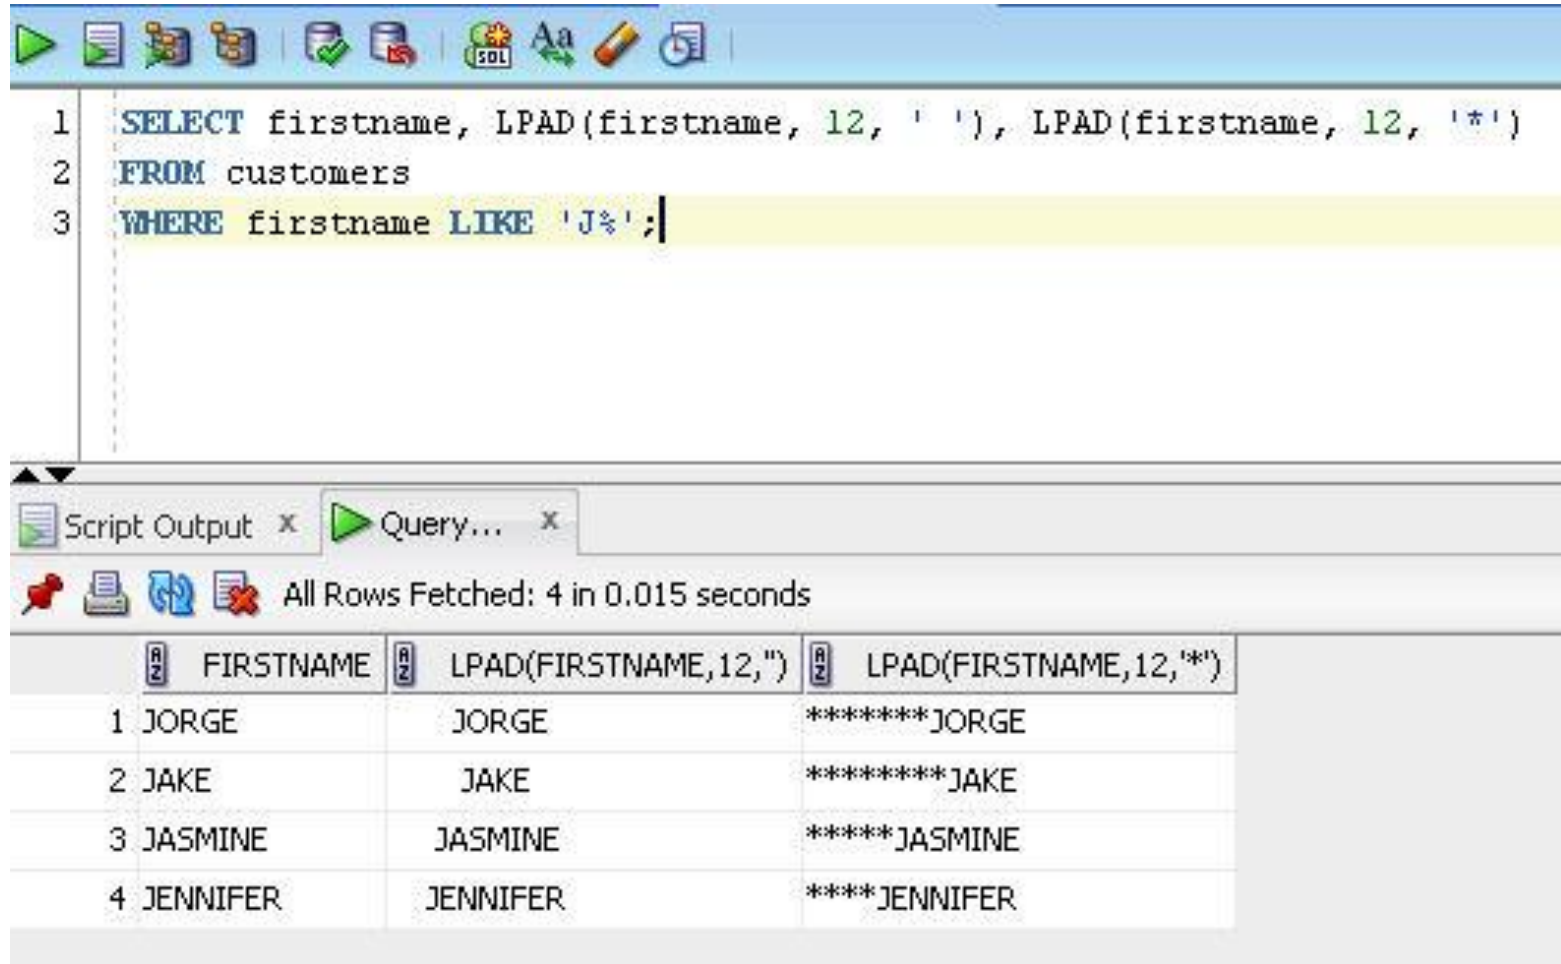

Below the editor, a results window titled "Query..." displays the output. It shows a table with one column, "LENGTH(ADDRESS)", and seven rows of data. The status bar indicates "All Rows Fetched: 7 in 0.015 seconds".

	LENGTH(ADDRESS)
1	20
2	18
3	17
4	16
5	13
6	12
7	11

LPAD AND RPAD FUNCTIONS

- The **LPAD** function can be used to pad or fill in the area to the left of a character string with a specific character or blank space
- For example, in some cheques that are sent out, blank spaces to the left of the digits on the cheque are padded with the asterisk character to make altering the cheque more difficult
- The syntax of the **LPAD** function is:
 - **LPAD(c, l, s)**
 - Where **c** represents the string to be padded, **l** represents the length of the character string after being padded and **s** represents the symbol or character to be used as padding

LPAD AND RPAD FUNCTIONS

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and other database operations. The main text area displays the following SQL query:

```
1 SELECT firstname, LPAD(firstname, 12, ' '), LPAD(firstname, 12, '*')
2 FROM customers
3 WHERE firstname LIKE 'J%';
```

Below the query editor, the 'Script Output' tab is active, showing the results of the query. The status bar indicates 'All Rows Fetched: 4 in 0.015 seconds'. The results are displayed in a table with four columns: an index column, the 'FIRSTNAME' column, the 'LPAD(FIRSTNAME,12,")' column, and the 'LPAD(FIRSTNAME,12,*)' column.

	FIRSTNAME	LPAD(FIRSTNAME,12,")	LPAD(FIRSTNAME,12,*)
1	JORGE	JORGE	*****JORGE
2	JAKE	JAKE	*****JAKE
3	JASMINE	JASMINE	*****JASMINE
4	JENNIFER	JENNIFER	*****JENNIFER

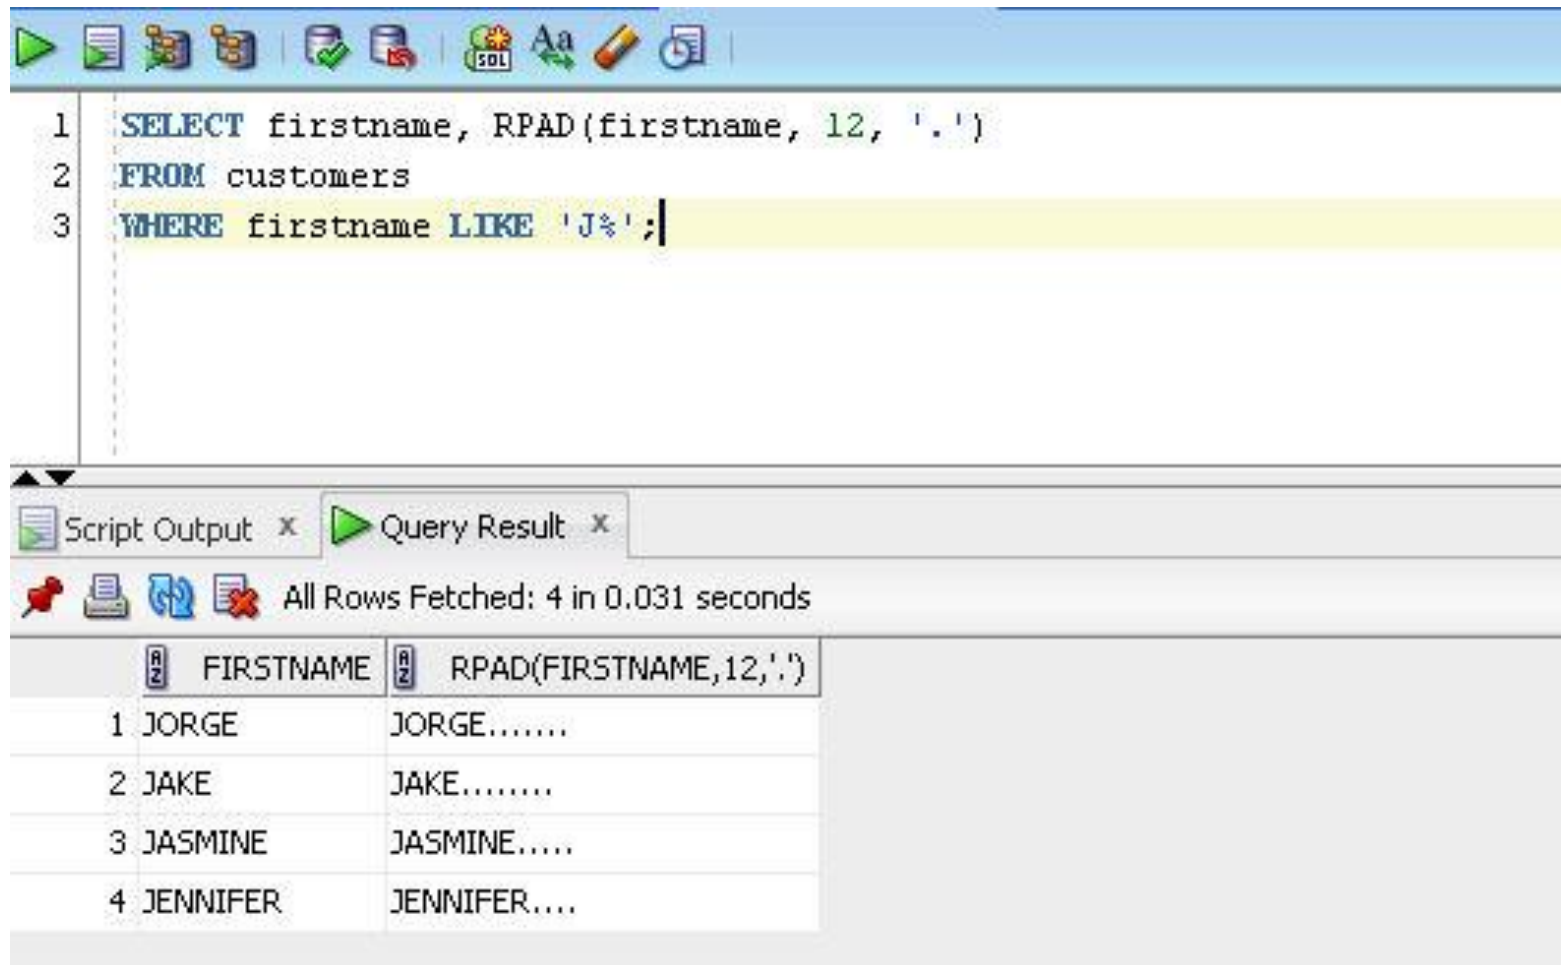

LPAD AND RPAD FUNCTIONS

- The arguments of the **LPAD** function (**firstname, 12, ' '**) indicate the following:
 - The firstname column is to be padded
 - The data contained in the firstname column is to be padded to a length of 12 characters. 12 is the total length, which includes both the data and the padding
 - A blank space is to be used as the padding symbol. The blank spaces are placed to the left of the customer's first name until the total length of 12 characters is reached
 - In our output, this actually right aligns the customer's first name in the second column of the output

LPAD AND RPAD FUNCTIONS

- The **RPAD** function uses a symbol to pad the right side of a character string to a specific width
- The syntax of the **RPAD** function is:
 - **RPAD(c, l, s)**
 - Where **c** represents the string to be padded, **l** represents the length of the character string after being padded and **s** represents the symbol or character to be used as padding

LPAD AND RPAD FUNCTIONS

The screenshot displays a SQL IDE interface. The top toolbar contains icons for execution, saving, undo, redo, and other standard database operations. The main editor window shows the following SQL query:

```
1 SELECT firstname, RPAD(firstname, 12, '.')
2 FROM customers
3 WHERE firstname LIKE 'J%';
```

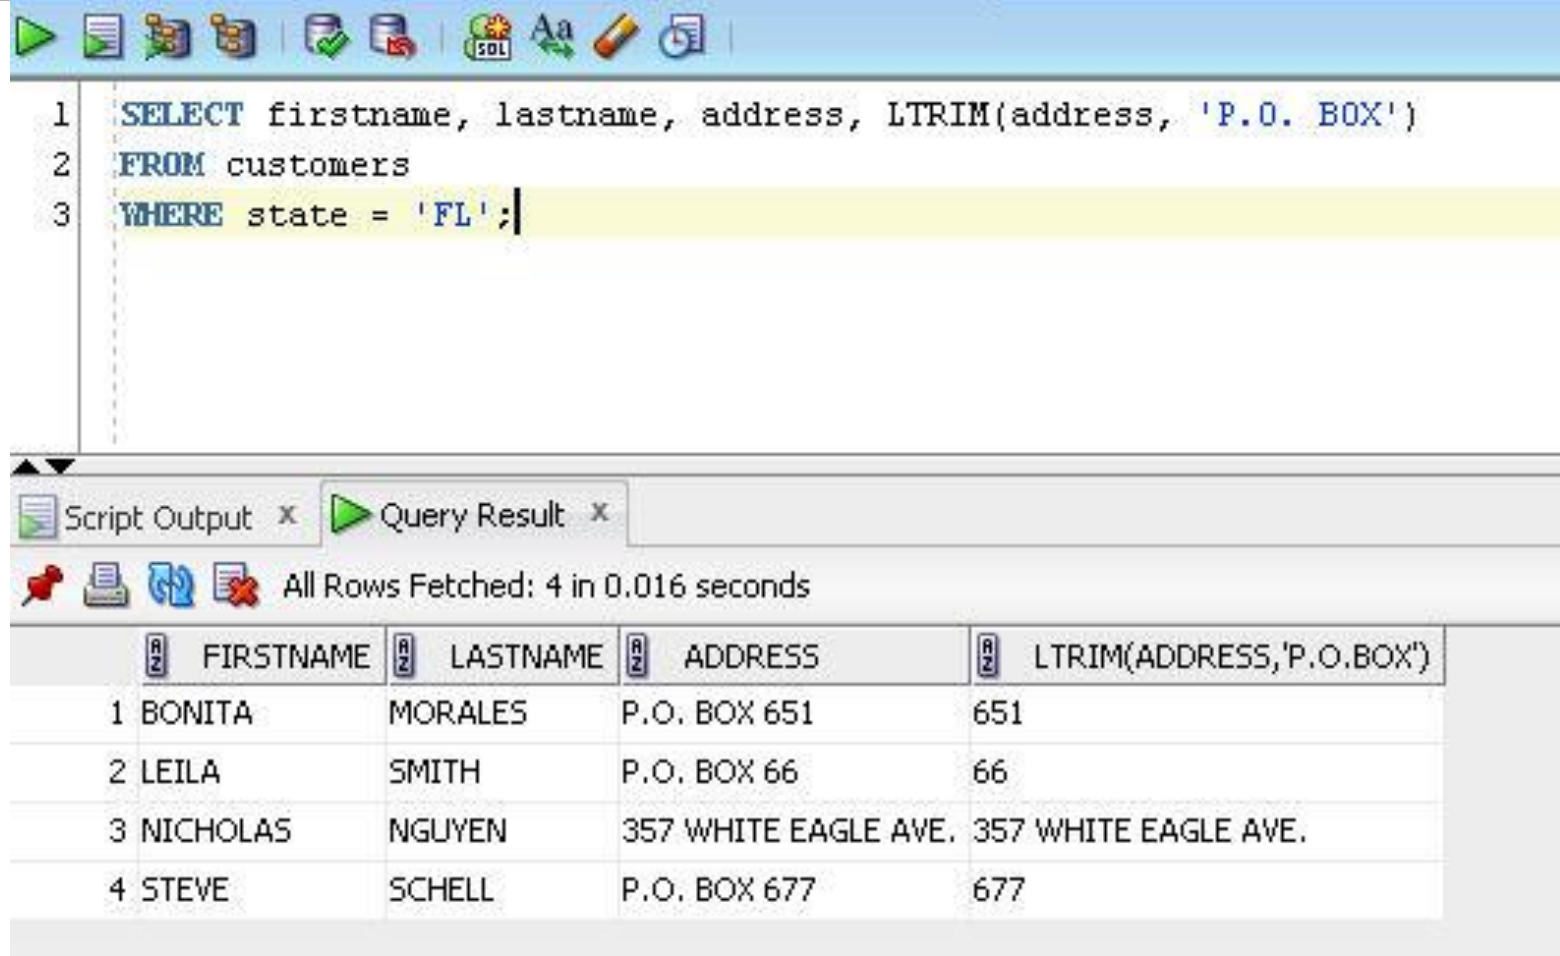

Below the editor, the 'Query Result' tab is active, showing the results of the query. The status bar indicates 'All Rows Fetched: 4 in 0.031 seconds'. The results are presented in a table with two columns: 'FIRSTNAME' and 'RPAD(FIRSTNAME,12,')'. The data rows are as follows:

	FIRSTNAME	RPAD(FIRSTNAME,12,')
1	JORGE	JORGE.....
2	JAKE	JAKE.....
3	JASMINE	JASMINE.....
4	JENNIFER	JENNIFER....

LTRIM AND RTRIM FUNCTIONS

- The **LTRIM** function can be used to remove a specific string of characters from the left side of a set of data
- The syntax for the **LTRIM** function is:
 - **LTRIM(c, s)**
 - Where **c** represents the data to be affected and **s** represents the string to be removed from the left side of the data
- For example, a preprinted form is being used to send a mailing to customers. The preprinted form already contains the string P. O. Box. Any customers in the CUSTOMERS table that contain P. O. Box as part of their address need to have the string removed from the data so only the actual Box number itself will display

LTRIM AND RTRIM FUNCTIONS

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and other database operations. The main editor displays the following SQL query:

```
1 SELECT firstname, lastname, address, LTRIM(address, 'P.O. BOX')
2 FROM customers
3 WHERE state = 'FL';
```

Below the editor, the 'Query Result' tab is active, showing the results of the query. The status bar indicates 'All Rows Fetched: 4 in 0.016 seconds'. The results are displayed in a table with the following columns: FIRSTNAME, LASTNAME, ADDRESS, and LTRIM(ADDRESS, 'P.O. BOX').

	FIRSTNAME	LASTNAME	ADDRESS	LTRIM(ADDRESS, 'P.O. BOX')
1	BONITA	MORALES	P.O. BOX 651	651
2	LEILA	SMITH	P.O. BOX 66	66
3	NICHOLAS	NGUYEN	357 WHITE EAGLE AVE.	357 WHITE EAGLE AVE.
4	STEVE	SHELL	P.O. BOX 677	677

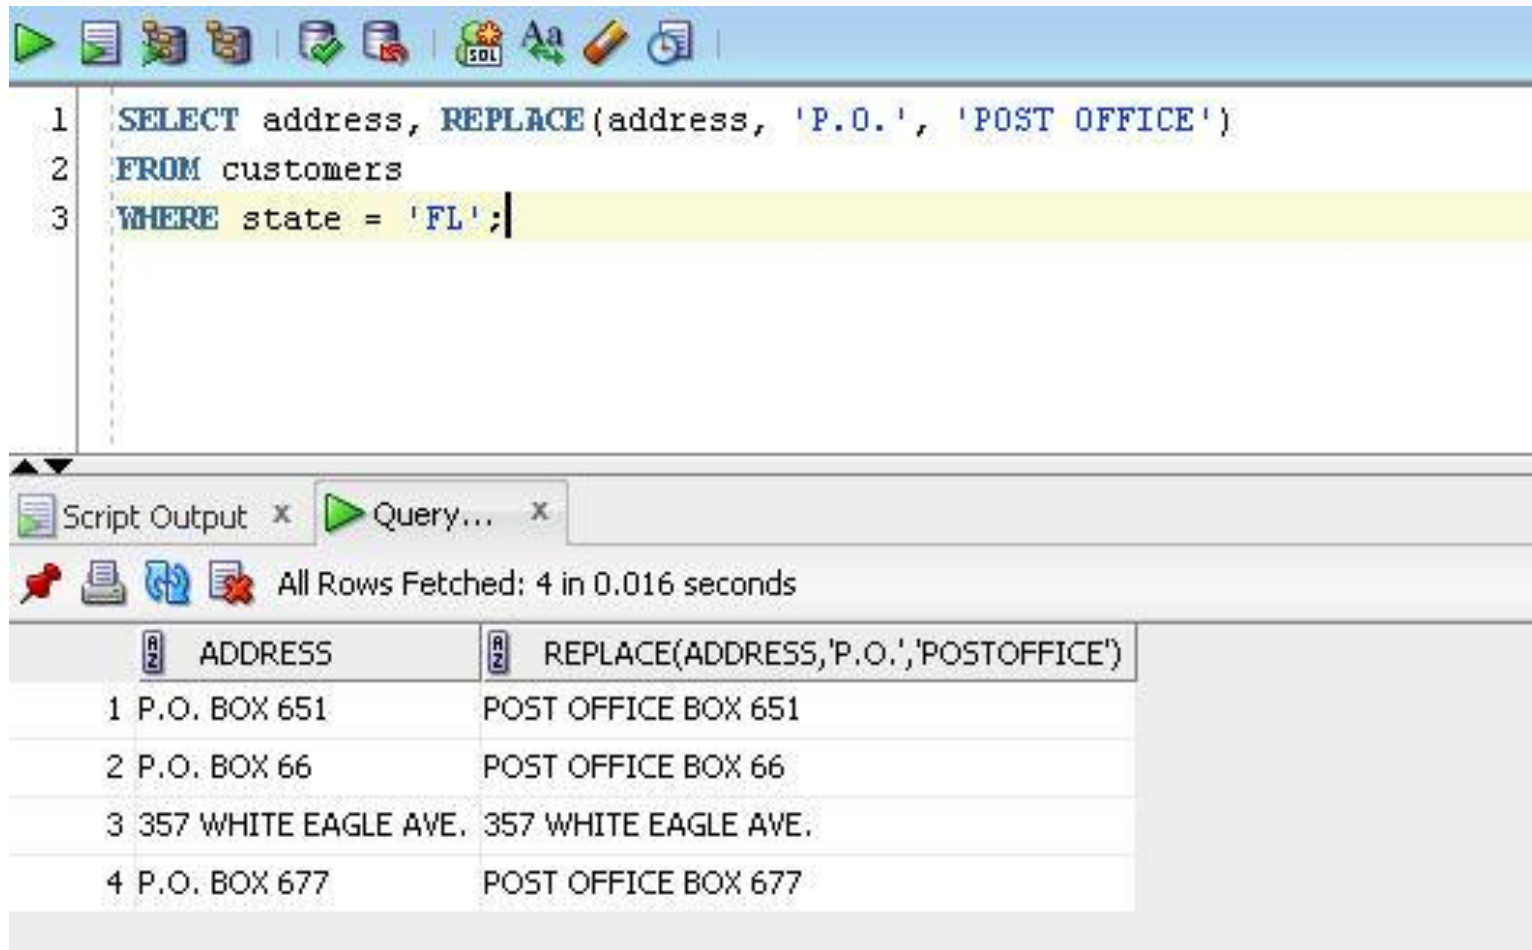

LTRIM AND RTRIM FUNCTIONS

- The RTRIM function removes specific characters from the right side of a set of data
- The syntax for the RTRIM function is:
 - **RTRIM(c, s)**
 - Where **c** represents the data to be affected and **s** is the string to be removed from the right side of the data

REPLACE FUNCTION

- The **REPLACE** function is similar to a “*search and replace*” function found in some application programs
- The **REPLACE** function looks for the occurrence of the specified string of characters, and, if it is found, replaces it with another set of specified characters
- The syntax for the **REPLACE** function is:
 - **REPLACE(c, s, r)**
 - Where **c** represents the data or column to be searched, **s** represents the string of characters to be replaced and **r** represents the string of characters to be substituted

REPLACE FUNCTION

The screenshot shows a SQL query editor with a toolbar at the top. The query is as follows:

```
1 SELECT address, REPLACE(address, 'P.O.', 'POST OFFICE')
2 FROM customers
3 WHERE state = 'FL';
```

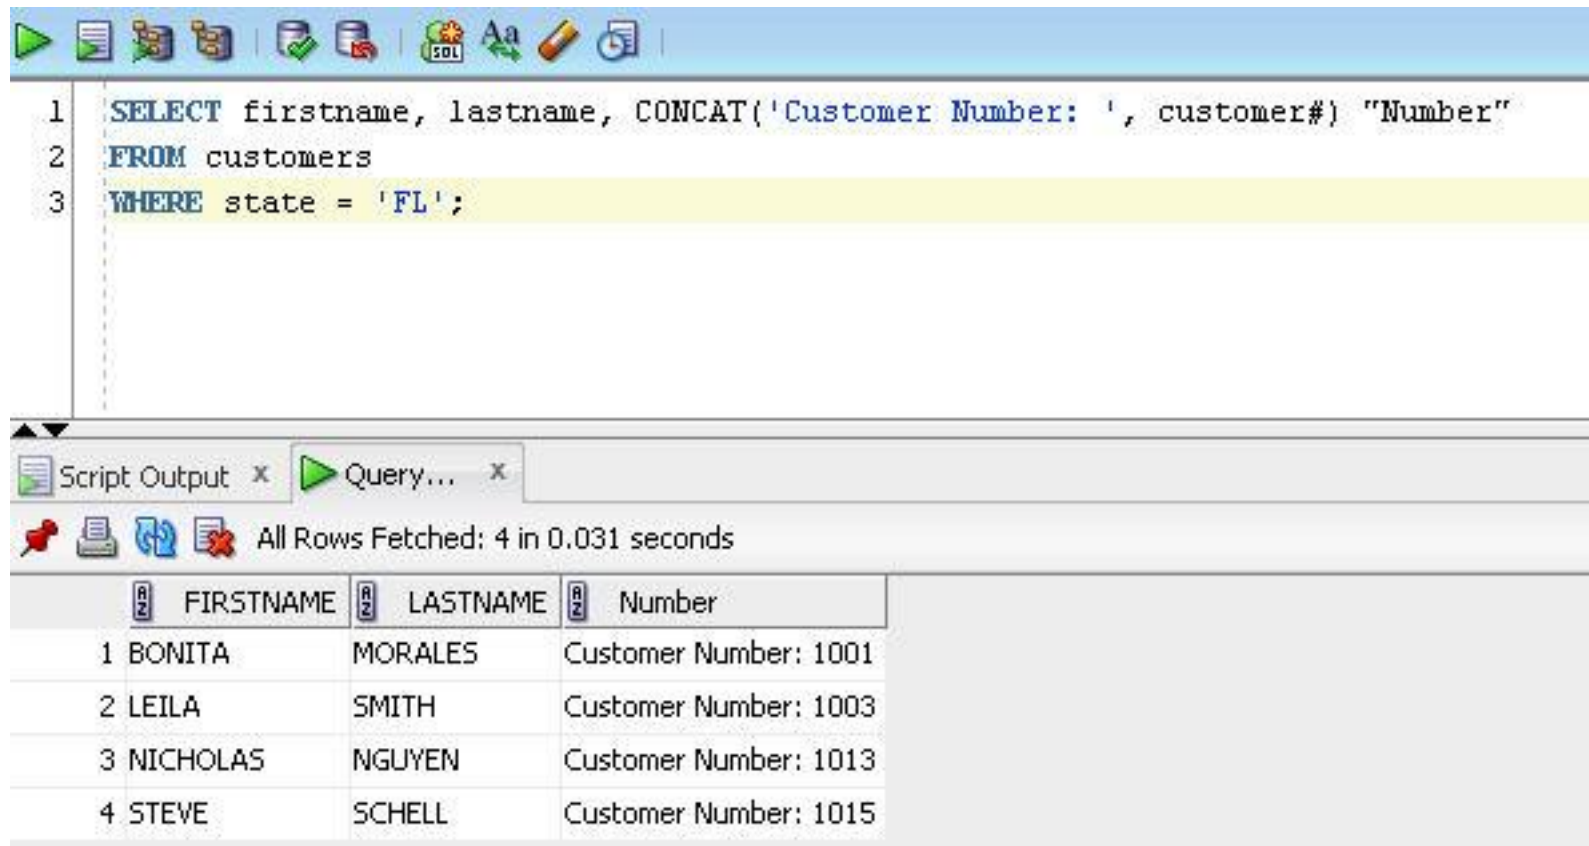

Below the query editor, the 'Script Output' tab is active, showing the results of the query. The status bar indicates 'All Rows Fetched: 4 in 0.016 seconds'.

	ADDRESS	REPLACE(ADDRESS,'P.O.','POSTOFFICE')
1	P.O. BOX 651	POST OFFICE BOX 651
2	P.O. BOX 66	POST OFFICE BOX 66
3	357 WHITE EAGLE AVE.	357 WHITE EAGLE AVE.
4	P.O. BOX 677	POST OFFICE BOX 677

CONCAT FUNCTION

- We have already seen one method to concatenate strings, the (||) operator
- CONCAT function can be used to concatenate data from two columns
- The concatenation operator is usually preferred since it is not limited to two items
- If you need more than two items with the CONCAT function you would have nest a CONCAT function inside another CONCAT function
- Syntax is CONCAT(c1, c2)
- Both c1 and c2 can be a column name or a string literal

CONCAT FUNCTION

The screenshot displays a SQL IDE interface. The top toolbar includes icons for execution, saving, and editing. The main editor shows a SQL query:

```
1 SELECT firstname, lastname, CONCAT('Customer Number: ', customer#) "Number"
2 FROM customers
3 WHERE state = 'FL';
```

Below the editor, the 'Script Output' tab is active, showing the query results. It indicates 'All Rows Fetched: 4 in 0.031 seconds'. The results are presented in a table with three columns: FIRSTNAME, LASTNAME, and Number.

	FIRSTNAME	LASTNAME	Number
1	BONITA	MORALES	Customer Number: 1001
2	LEILA	SMITH	Customer Number: 1003
3	NICHOLAS	NGUYEN	Customer Number: 1013
4	STEVE	SCHELL	Customer Number: 1015

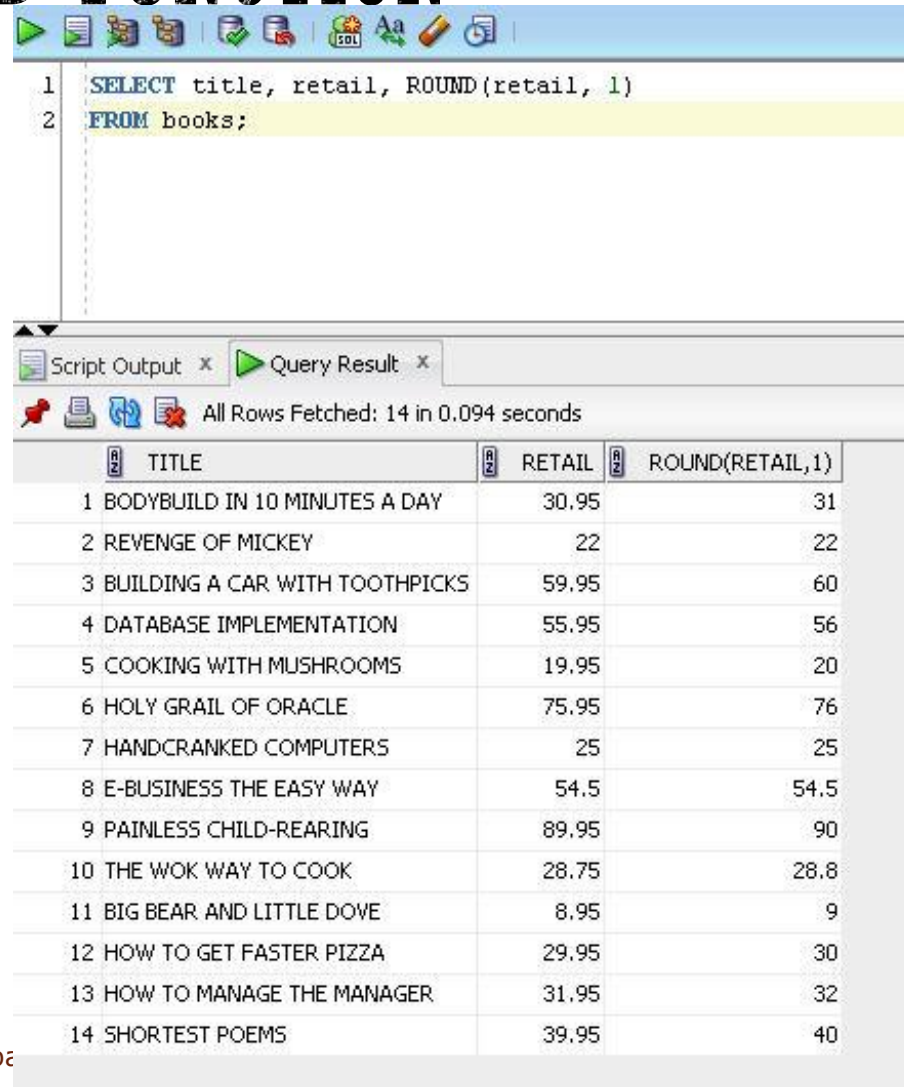

NUMBER FUNCTIONS

- Oracle 12c provides a set of functions that are specifically designed for the manipulation of numeric data
- In daily operations, there are two popular number functions, **ROUND, TRUNC, MOD, ABS, and POWER**

ROUND FUNCTION

- The **ROUND** function is designed to round numeric values to the given precision
- The syntax of the **ROUND** function is:
 - **ROUND(n, p)**
 - Where **n** represents the numeric data or column to be rounded and **p** represents the position of the digit to which the data should be rounded
 - If **p** is a positive number then round on the right side of the decimal position
 - If **p** is a negative number then round on the left side of the decimal position

ROUND FUNCTION

```
1 SELECT title, retail, ROUND(retail, 1)
2 FROM books;
```

Script Output x Query Result x

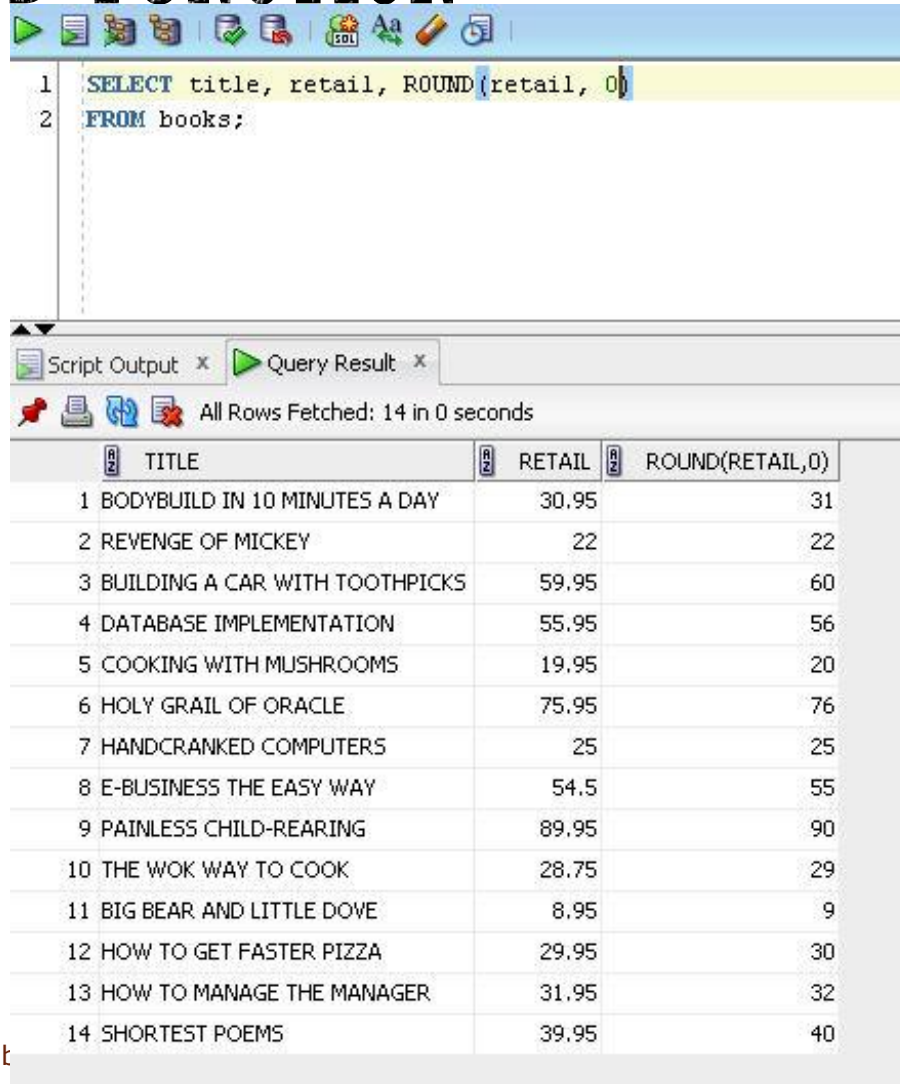

All Rows Fetched: 14 in 0.094 seconds

R	TITLE	R	RETAIL	R	ROUND(RETAIL,1)
1	BODYBUILD IN 10 MINUTES A DAY		30.95		31
2	REVENGE OF MICKEY		22		22
3	BUILDING A CAR WITH TOOTHPICKS		59.95		60
4	DATABASE IMPLEMENTATION		55.95		56
5	COOKING WITH MUSHROOMS		19.95		20
6	HOLY GRAIL OF ORACLE		75.95		76
7	HANDCRANKED COMPUTERS		25		25
8	E-BUSINESS THE EASY WAY		54.5		54.5
9	PAINLESS CHILD-REARING		89.95		90
10	THE WOK WAY TO COOK		28.75		28.8
11	BIG BEAR AND LITTLE DOVE		8.95		9
12	HOW TO GET FASTER PIZZA		29.95		30
13	HOW TO MANAGE THE MANAGER		31.95		32
14	SHORTEST POEMS		39.95		40

Most are rounded to the nearest dollar. They round up to an even dollar because of the 95 in the original data.

Look at The Wok Way to Cook. It is rounded up to 8 from .75

ROUND FUNCTION

```
1 SELECT title, retail, ROUND(retail, 0)
2 FROM books;
```

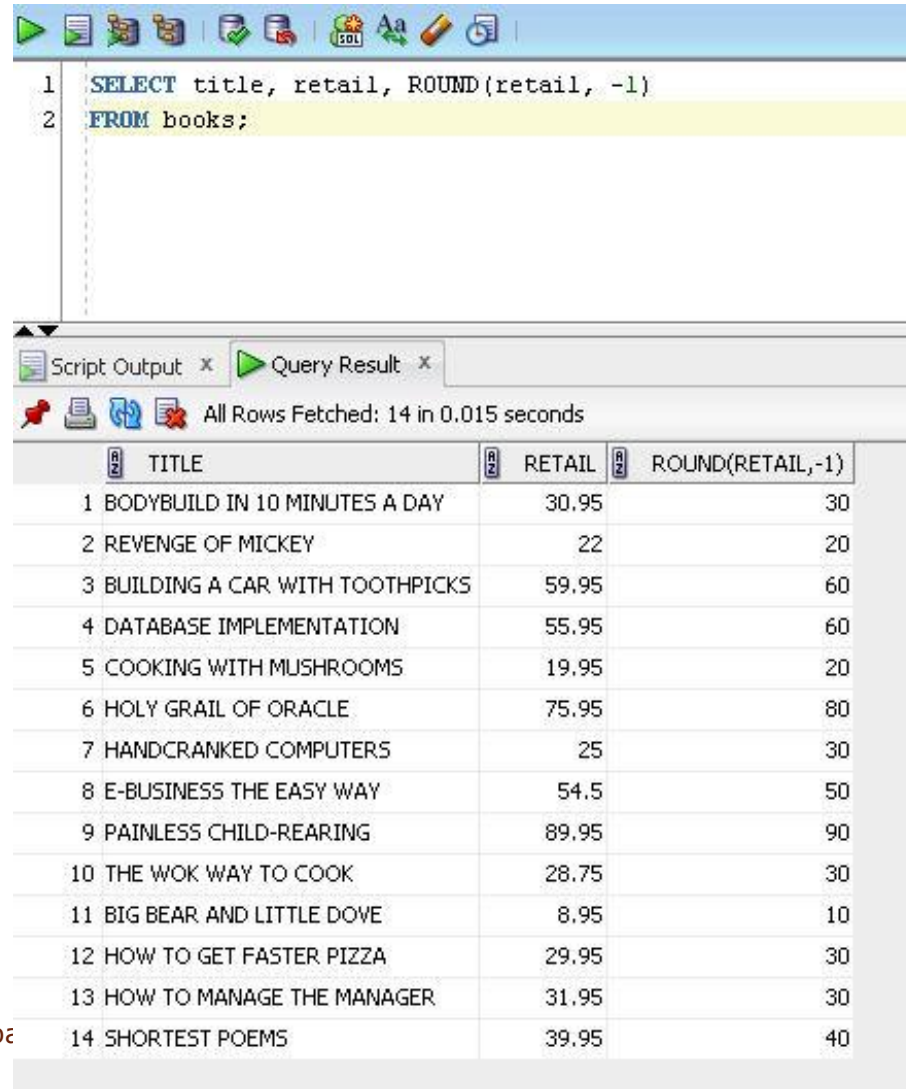

Script Output x Query Result x

All Rows Fetched: 14 in 0 seconds

R	TITLE	R	RETAIL	R	ROUND(RETAIL,0)
1	BODYBUILD IN 10 MINUTES A DAY		30.95		31
2	REVENGE OF MICKEY		22		22
3	BUILDING A CAR WITH TOOTHPICKS		59.95		60
4	DATABASE IMPLEMENTATION		55.95		56
5	COOKING WITH MUSHROOMS		19.95		20
6	HOLY GRAIL OF ORACLE		75.95		76
7	HANDCRANKED COMPUTERS		25		25
8	E-BUSINESS THE EASY WAY		54.5		55
9	PAINLESS CHILD-REARING		89.95		90
10	THE WOK WAY TO COOK		28.75		29
11	BIG BEAR AND LITTLE DOVE		8.95		9
12	HOW TO GET FASTER PIZZA		29.95		30
13	HOW TO MANAGE THE MANAGER		31.95		32
14	SHORTEST POEMS		39.95		40

A value of 0 for p indicates that the number should be rounded to the nearest whole number with no decimal places

ROUND FUNCTION

The screenshot shows a database query tool interface. At the top, a SQL query is entered in a text area:

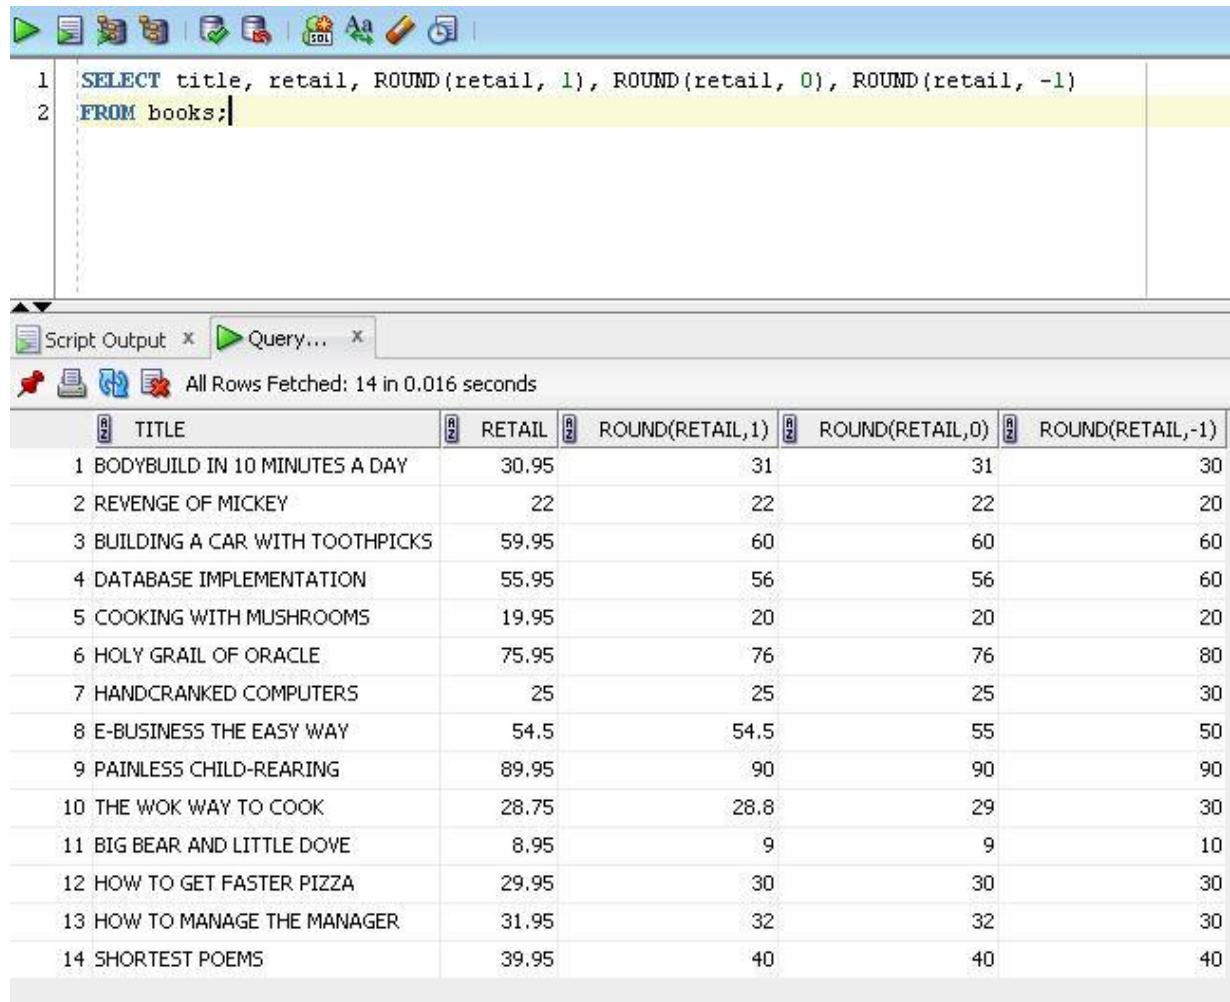

```
1 SELECT title, retail, ROUND(retail, -1)
2 FROM books;
```

Below the query area, there are tabs for 'Script Output' and 'Query Result'. The 'Query Result' tab is active, displaying a table with 14 rows. The table has three columns: 'TITLE', 'RETAIL', and 'ROUND(RETAIL,-1)'. The data is as follows:

	TITLE	RETAIL	ROUND(RETAIL,-1)
1	BODYBUILD IN 10 MINUTES A DAY	30.95	30
2	REVENGE OF MICKEY	22	20
3	BUILDING A CAR WITH TOOTHPICKS	59.95	60
4	DATABASE IMPLEMENTATION	55.95	60
5	COOKING WITH MUSHROOMS	19.95	20
6	HOLY GRAIL OF ORACLE	75.95	80
7	HANDCRANKED COMPUTERS	25	30
8	E-BUSINESS THE EASY WAY	54.5	50
9	PAINLESS CHILD-REARING	89.95	90
10	THE WOK WAY TO COOK	28.75	30
11	BIG BEAR AND LITTLE DOVE	8.95	10
12	HOW TO GET FASTER PIZZA	29.95	30
13	HOW TO MANAGE THE MANAGER	31.95	30
14	SHORTEST POEMS	39.95	40

The -1 indicates rounding on the left side of the decimal. This would round to the nearest tens of dollars

ROUND FUNCTION

```

1 SELECT title, retail, ROUND(retail, 1), ROUND(retail, 0), ROUND(retail, -1)
2 FROM books;

```

	TITLE	RETAIL	ROUND(RETAIL,1)	ROUND(RETAIL,0)	ROUND(RETAIL,-1)
1	BODYBUILD IN 10 MINUTES A DAY	30.95	31	31	30
2	REVENGE OF MICKEY	22	22	22	20
3	BUILDING A CAR WITH TOOTHPICKS	59.95	60	60	60
4	DATABASE IMPLEMENTATION	55.95	56	56	60
5	COOKING WITH MUSHROOMS	19.95	20	20	20
6	HOLY GRAIL OF ORACLE	75.95	76	76	80
7	HANDCRANKED COMPUTERS	25	25	25	30
8	E-BUSINESS THE EASY WAY	54.5	54.5	55	50
9	PAINLESS CHILD-REARING	89.95	90	90	90
10	THE WOK WAY TO COOK	28.75	28.8	29	30
11	BIG BEAR AND LITTLE DOVE	8.95	9	9	10
12	HOW TO GET FASTER PIZZA	29.95	30	30	30
13	HOW TO MANAGE THE MANAGER	31.95	32	32	30
14	SHORTEST POEMS	39.95	40	40	40

Comparison of the three methods beside each other

TRUNC FUNCTION

- The **TRUNC** function is used to truncate numeric data rather than round it
- The **TRUNC** function can be used to truncate numeric data to a specific position. Any numbers after that position are simply removed or dropped off
- The syntax for the TRUNC function is:
 - **TRUNC(n, p)**
 - Where **n** represents the numeric data or field to be truncated and **p** represents the position from the digit from which the data should be removed
 - Whether **p** is *positive* or *negative*, it follows the same rules as it did for the **ROUND** function

TRUNC FUNCTION

```
1 SELECT title, retail, TRUNC(retail, 1), TRUNC(retail, 0), TRUNC(retail, -1)
2 FROM books;
```

Script Output x Query... x

All Rows Fetched: 14 in 0.031 seconds

	TITLE	RETAIL	TRUNC(RETAIL,1)	TRUNC(RETAIL,0)	TRUNC(RETAIL,-1)
1	BODYBUILD IN 10 MINUTES A DAY	30.95	30.9	30	30
2	REVENGE OF MICKEY	22	22	22	20
3	BUILDING A CAR WITH TOOTHPICKS	59.95	59.9	59	50
4	DATABASE IMPLEMENTATION	55.95	55.9	55	50
5	COOKING WITH MUSHROOMS	19.95	19.9	19	10
6	HOLY GRAIL OF ORACLE	75.95	75.9	75	70
7	HANDCRANKED COMPUTERS	25	25	25	20
8	E-BUSINESS THE EASY WAY	54.5	54.5	54	50
9	PAINLESS CHILD-REARING	89.95	89.9	89	80
10	THE WOK WAY TO COOK	28.75	28.7	28	20
11	BIG BEAR AND LITTLE DOVE	8.95	8.9	8	0
12	HOW TO GET FASTER PIZZA	29.95	29.9	29	20
13	HOW TO MANAGE THE MANAGER	31.95	31.9	31	30
14	SHORTEST POEMS	39.95	39.9	39	30

TRUNC function used with a p value of 1, 0 and -1. With -1, the digit to the left of the decimal reverts to a zero, it is still needed as a placeholder

MOD FUNCTION

- The MOD function returns the remainder only of a division operation
- The two arguments are needed for the function are the numerator and denominator of the division operation
- We want to convert the total ounces into pounds and ounces
- The decimal amount might not be easily used by someone needing to know the weight in pounds and ounces

MOD FUNCTION

The screenshot shows an SQL IDE interface. The top toolbar includes icons for execution, saving, and other database functions, along with a timer showing 0.28099999 seconds. The main editor contains two SQL queries. The first query is `SELECT 235/16 FROM dual;`. The second query is `SELECT TRUNC(235/16,0) LBS, MOD(235,16) OZ FROM dual;`. Below the editor, there are two tabs: 'Script Output' and 'Query Result'. The 'Query Result' tab is active and shows the results of the second query. The results are displayed in a table with two columns: 'LBS' and 'OZ'. The first row shows the values '14' and '11' respectively.

```
1 SELECT 235/16
2 FROM dual;
3
4 SELECT TRUNC(235/16,0) LBS, MOD(235,16) OZ
5 FROM dual;
```

Script Output x Query Result x

Task completed in 0.281 seconds

235/16	

14.6875	
LBS	OZ

14	11

We will discuss the use of the DUAL table later in this chapter

MOD FUNCTION

The screenshot shows a SQL query window with the following content:

```
SELECT 235/16  
FROM DUAL;  
  
SELECT TRUNC(235/16,0) LBS, MOD(235,16) OZ  
FROM DUAL;
```

Below the query area are four buttons: Execute, Load Script, Save Script, and Cancel.

The results are displayed in two tables. The first table has a single column with the header **235/16** and a value of 14.6875. The second table has two columns, **LBS** and **OZ**, with values 14 and 11 respectively.

Handwritten annotations to the right of the results show the calculation: $16 \times 14 = 224$ and $235 - 224 = 11$. Arrows point from these calculations to the values 14 and 11 in the second table.

235/16	
14.6875	

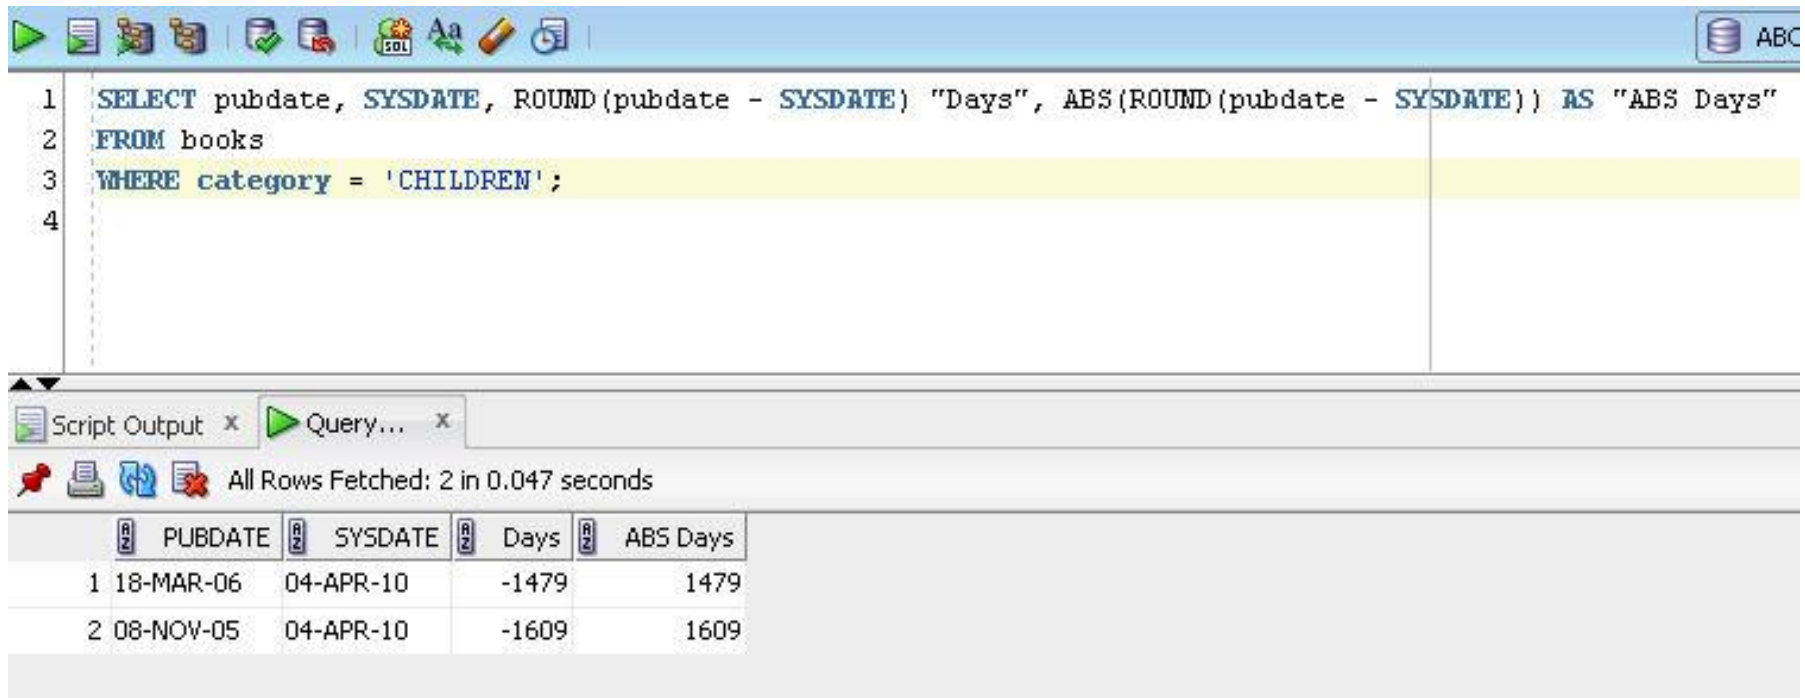

LBS	OZ
14	11

FIGURE 10-19 Using the MOD function to return the remainder

ABS FUNCTION

- The ABS (Absolute) function returns the absolute or positive value of the numeric value provided as the argument
- If you are only concerned with the difference of two date values and not the order of the date values used in the calculation use the ABS function to always return the absolute value of the result

ABS FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and other database operations. The main text area displays a SQL query:

```
1 SELECT pubdate, SYSDATE, ROUND (pubdate - SYSDATE) "Days", ABS (ROUND (pubdate - SYSDATE)) AS "ABS Days"
2 FROM books
3 WHERE category = 'CHILDREN';
4
```

Below the query editor, the 'Script Output' tab is active, showing the execution status: 'All Rows Fetched: 2 in 0.047 seconds'. The results are displayed in a table with the following columns: PUBDATE, SYSDATE, Days, and ABS Days.

	PUBDATE	SYSDATE	Days	ABS Days
1	18-MAR-06	04-APR-10	-1479	1479
2	08-NOV-05	04-APR-10	-1609	1609

POWER FUNCTION

- The POWER function raises the number in the first argument to the power indicated in the second argument
- The syntax of the POWER function is:
 - `POWER(x, y)`
- Where x is the number you are raising and y represents the power you are raising it to

POWER FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains various icons for execution, formatting, and editing. The main editor area contains the following SQL query:

```
1 SELECT POWER (2, 3), POWER (2, 8)
2 FROM dual;
```

Below the editor is a 'Script Output' tab with a 'Query...' button. The output area displays the message 'All Rows Fetched: 1 in 0.015 seconds'. Below this, a table shows the results of the query:

	POWER(2,3)	POWER(2,8)
1	8	256

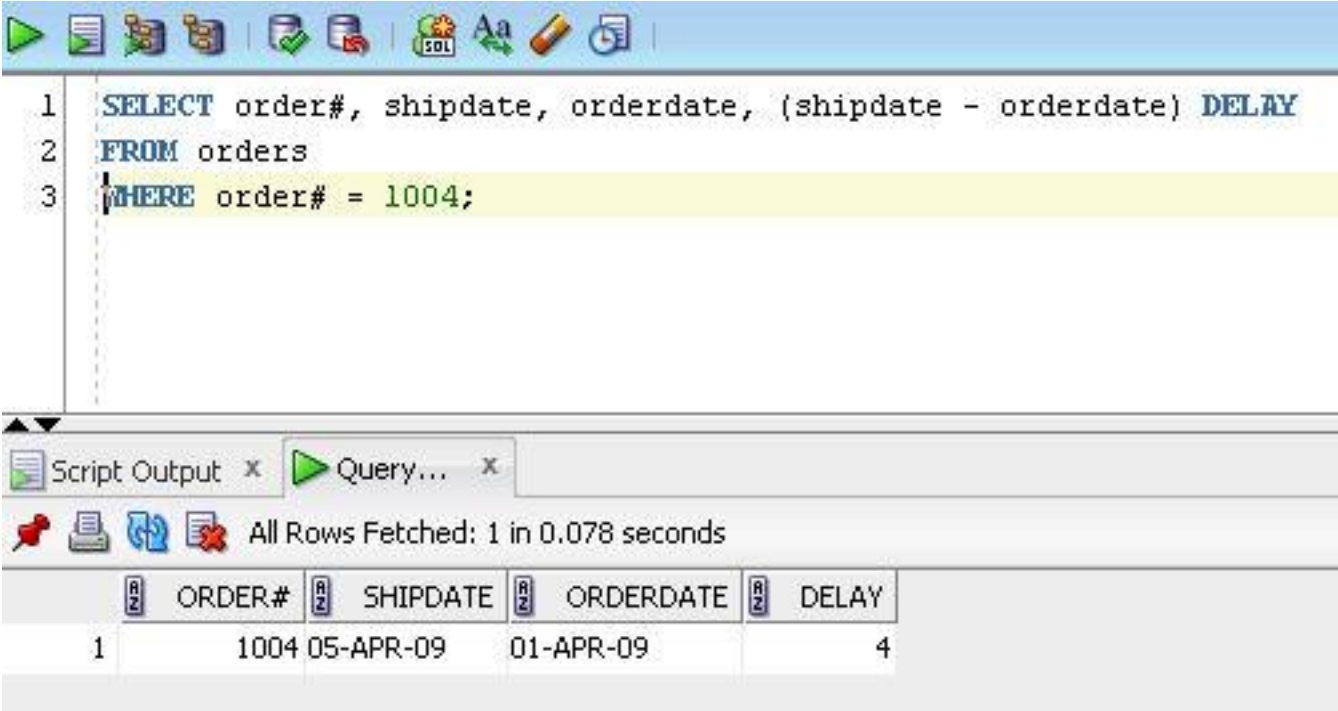

DATE FUNCTIONS

- The **DATE** function of Oracle 12c displays date values in a **DD-MON-RR** format that represents a 2-digit day, 3-letter month abbreviation and a 2-digit year
- March 5, 2003 would be stored as 05-MAR-03
- A date is referenced as a non-numeric field and is enclosed in single quotation marks
- Internally it is stored as a numeric value representing the *century, year, month, day, hours, minutes, and seconds*
- The valid range for a date is *4712 B.C. to 9999 A.D.*
- Although a date appears as a non-numeric field, users can perform calculations on dates because they are stored internally as numbers

DATE FUNCTIONS

- The internal numeric version of the date used by Oracle 12c is a **Julian** date
- A **Julian** date represents the number of days that have passed from a specific date and 4712 B.C.
- If you need to calculate the number of days between two dates
- Oracle first converts the dates to the **Julian** date format, then determines the difference between the two dates

DATE FUNCTIONS

The screenshot shows a SQL query editor with a toolbar at the top. The query text is as follows:

```
1 SELECT order#, shipdate, orderdate, (shipdate - orderdate) DELAY
2 FROM orders
3 WHERE order# = 1004;
```

Below the query editor, the 'Script Output' tab is active, displaying the results of the query. The status bar indicates 'All Rows Fetched: 1 in 0.078 seconds'. The results are shown in a table with the following columns: ORDER#, SHIPDATE, ORDERDATE, and DELAY.

	ORDER#	SHIPDATE	ORDERDATE	DELAY
1	1004	05-APR-09	01-APR-09	4

Results display the number of days that occur between the 2 dates specified

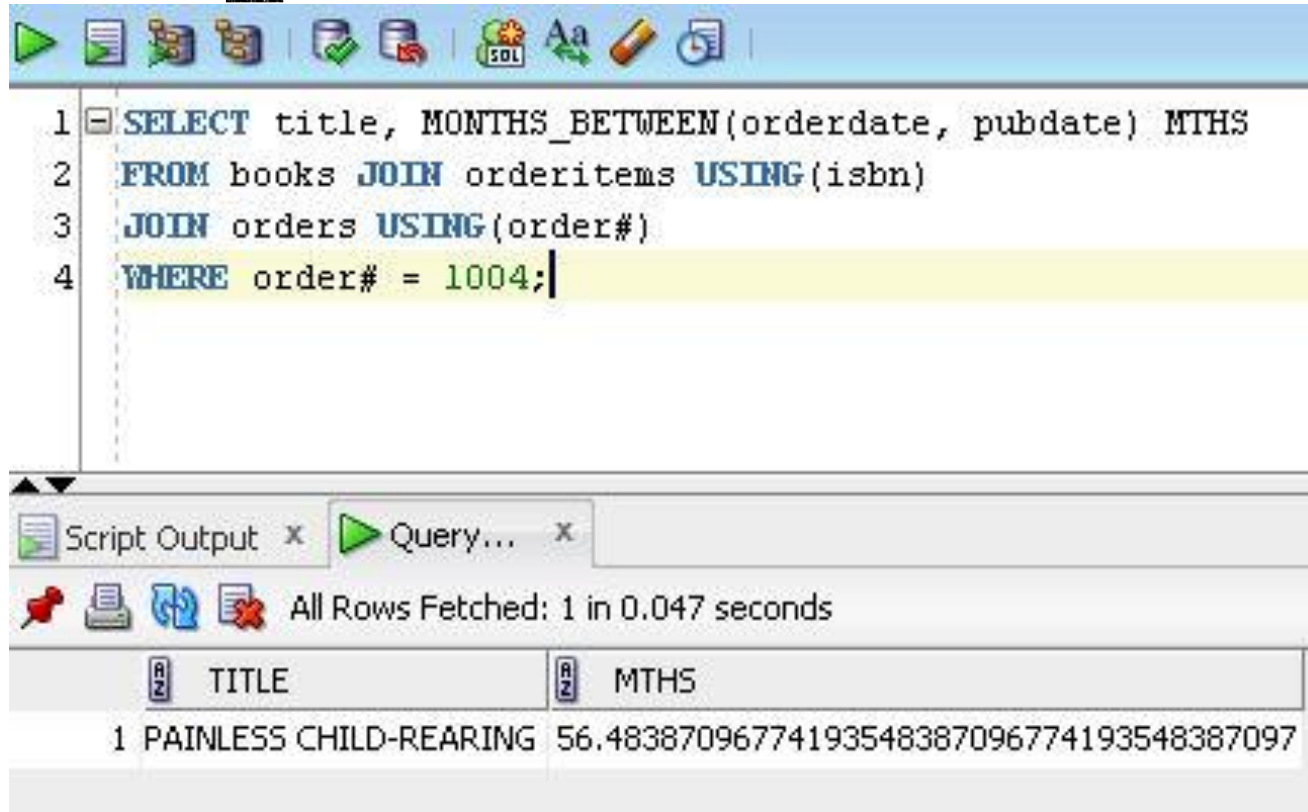

DATE FUNCTIONS

- If you wanted to know the number of months between two dates, it becomes a little tricky since not all months have the same number of days
- Oracle 12c provides several functions to assist in these kinds of calculations:
 - **MONTHS_BETWEEN**
 - **ADD_MONTHS**
 - **NEXT_DAY**
 - **LAST_DAY**
 - **TO_DATE**

MONTHS_BETWEEN FUNCTION

- Management would like to know whether customers are ordering books that have recently been released, or books that were published several months or even several years ago
- You could do as we saw previously; subtract publication date from order date to show the number of days or even weeks
- Instead, we can use the **MONTHS_BETWEEN** function to determine the number of months between two dates
- Syntax is:
 - **MONTHS_BETWEEN(d1, d2)**
 - Where **d1** and **d2** are dates and **d2** is subtracted from **d1**

MONTHS_BETWEEN FUNCTION

The screenshot shows a SQL IDE window with a query editor and a results pane. The query editor contains the following SQL code:

```
1 SELECT title, MONTHS_BETWEEN(orderdate, pubdate) MTHS
2 FROM books JOIN orderitems USING(isbn)
3 JOIN orders USING(order#)
4 WHERE order# = 1004;
```

The results pane shows the output of the query, with columns titled 'TITLE' and 'MTHS'. The first row of data is:

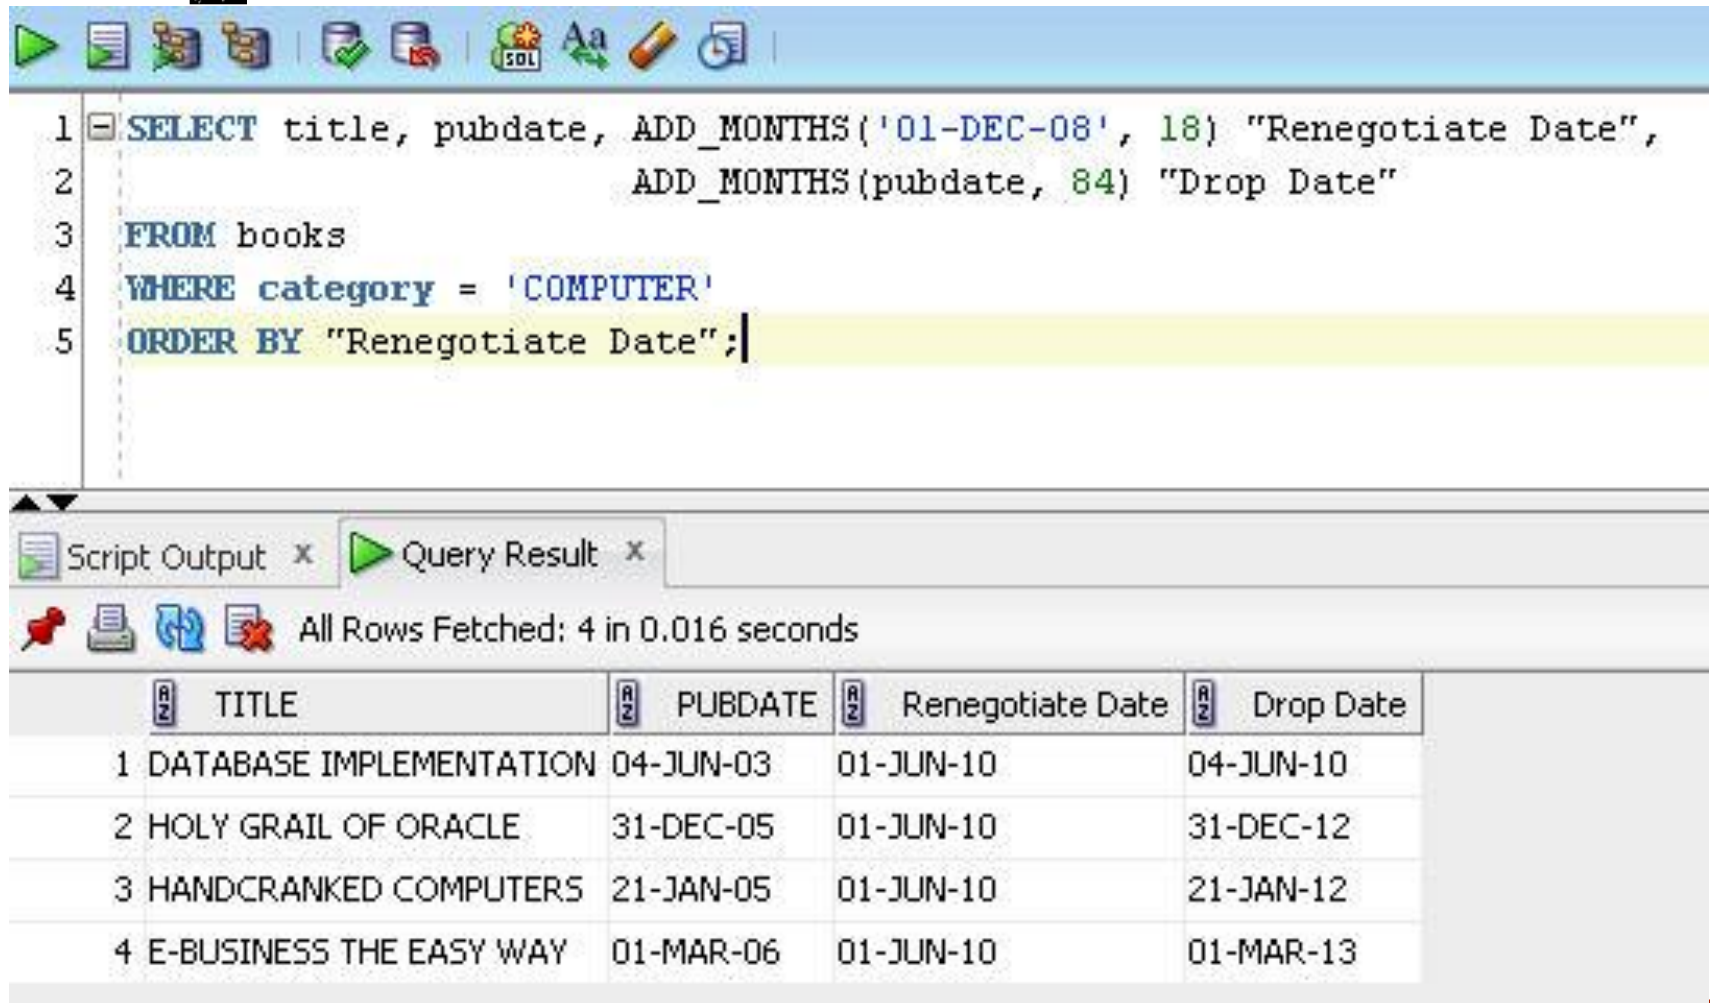

TITLE	MTHS
1 PAINLESS CHILD-REARING	56.48387096774193548387096774193548387097

If you wanted to remove the decimal portion of the output, you could truncate the result so only the integer portion is seen.
More on this later

ADD_MONTHS FUNCTION

- Just Lee Books would like to drop any inventory that has been in stock for longer than 5 years
- We need to produce a list showing the publication date and the drop date for all books in inventory
- We could simply add (365×5) to the publication date or could use the **ADD_MONTHS** function which is a better solution
- The syntax for the ADD_MONTHS function is:
 - **ADD_MONTHS(d, m)**
 - Where **d** represents the beginning date and **m** represents the number of months to add to **d**

ADD_MONTHS FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and editing. The main editor displays the following SQL query:

```
1 SELECT title, pubdate, ADD_MONTHS('01-DEC-08', 18) "Renegotiate Date",  
2 ADD_MONTHS(pubdate, 84) "Drop Date"  
3 FROM books  
4 WHERE category = 'COMPUTER'  
5 ORDER BY "Renegotiate Date";
```

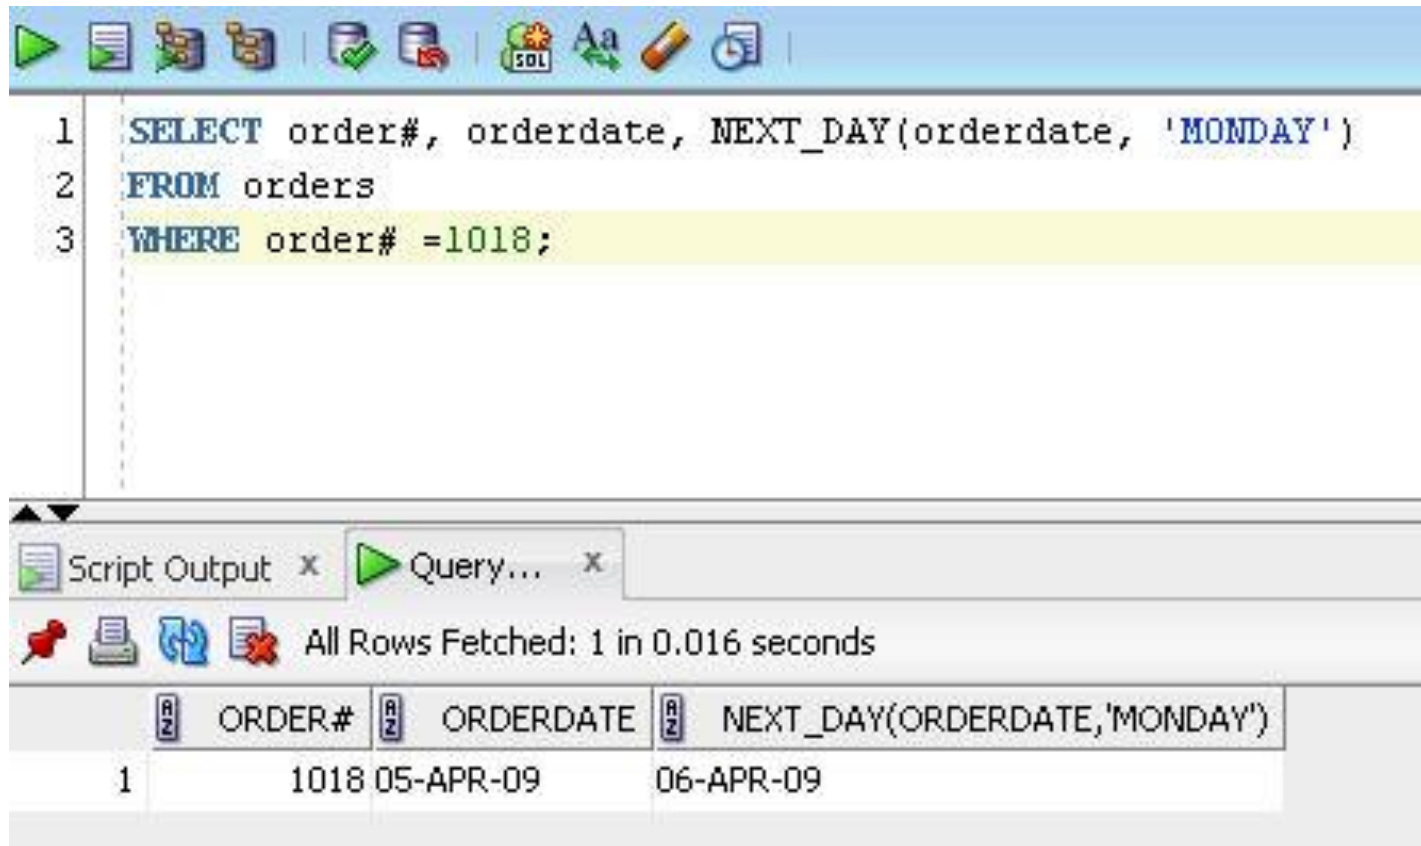

Below the editor, the 'Query Result' tab is active, showing the execution status: 'All Rows Fetched: 4 in 0.016 seconds'. The results are displayed in a table with the following columns: TITLE, PUBDATE, Renegotiate Date, and Drop Date.

	TITLE	PUBDATE	Renegotiate Date	Drop Date
1	DATABASE IMPLEMENTATION	04-JUN-03	01-JUN-10	04-JUN-10
2	HOLY GRAIL OF ORACLE	31-DEC-05	01-JUN-10	31-DEC-12
3	HANDCRANKED COMPUTERS	21-JAN-05	01-JUN-10	21-JAN-12
4	E-BUSINESS THE EASY WAY	01-MAR-06	01-JUN-10	01-MAR-13

NEXT_DAY FUNCTION

- Just Lee Books has a policy that books must be shipped by the first Monday after they receive a customer's order
- The **NEXT_DAY** function can be used to determine the next occurrence of a specific day of the week and the give you the actual date of that day
- The syntax for the **NEXT_DAY** function is:
 - **NEXT_DAY(d, DAY)**
 - Where **d** represents the starting date and **DAY** represents the day of the week to be identified

NEXT_DAY FUNCTION

The screenshot shows a SQL IDE interface. The top toolbar contains icons for running queries, saving, and editing. The main text area displays the following SQL query:

```
1 SELECT order#, orderdate, NEXT_DAY(orderdate, 'MONDAY')
2 FROM orders
3 WHERE order# =1018;
```

Below the query editor, the 'Script Output' tab is active, showing the execution status: 'All Rows Fetched: 1 in 0.016 seconds'. The results are displayed in a table with three columns: ORDER#, ORDERDATE, and NEXT_DAY(ORDERDATE,'MONDAY').

	ORDER#	ORDERDATE	NEXT_DAY(ORDERDATE,'MONDAY')
1	1018	05-APR-09	06-APR-09

The next Monday from the order date is April 6th

LAST_DAY FUNCTION

- Similar to NEXT_DAY function except it always determines the last day of the month for the month of two selected order dates

LAST_DAY FUNCTION

The screenshot displays a SQL IDE interface. The top toolbar contains icons for running queries, saving, and editing. The main editor window shows the following SQL query:

```
1 SELECT order#, orderdate, LAST_DAY(orderdate)
2 FROM orders
3 WHERE order# IN(1002, 1003);
```

Below the editor, the 'Script Output' and 'Query...' tabs are visible. The status bar indicates 'All Rows Fetched: 2 in 0.016 seconds'. The results are displayed in a table with three columns: ORDER#, ORDERDATE, and LAST_DAY(ORDERDATE).

	ORDER#	ORDERDATE	LAST_DAY(ORDERDATE)
1	1002	31-MAR-09	31-MAR-09
2	1003	01-APR-09	30-APR-09

TO_DATE FUNCTION

- The **TO_DATE** function is of particular interest to application developers since it permits the user to enter the date in any format
- This date is then converted to the standard Oracle 12c default format for storage
- The syntax for the **TO_DATE** function:
 - **TO_DATE(d, 'f')**
 - Where **d** represents the date being entered by the user and **f** represents the format for the date entered

TO_DATE FUNCTION

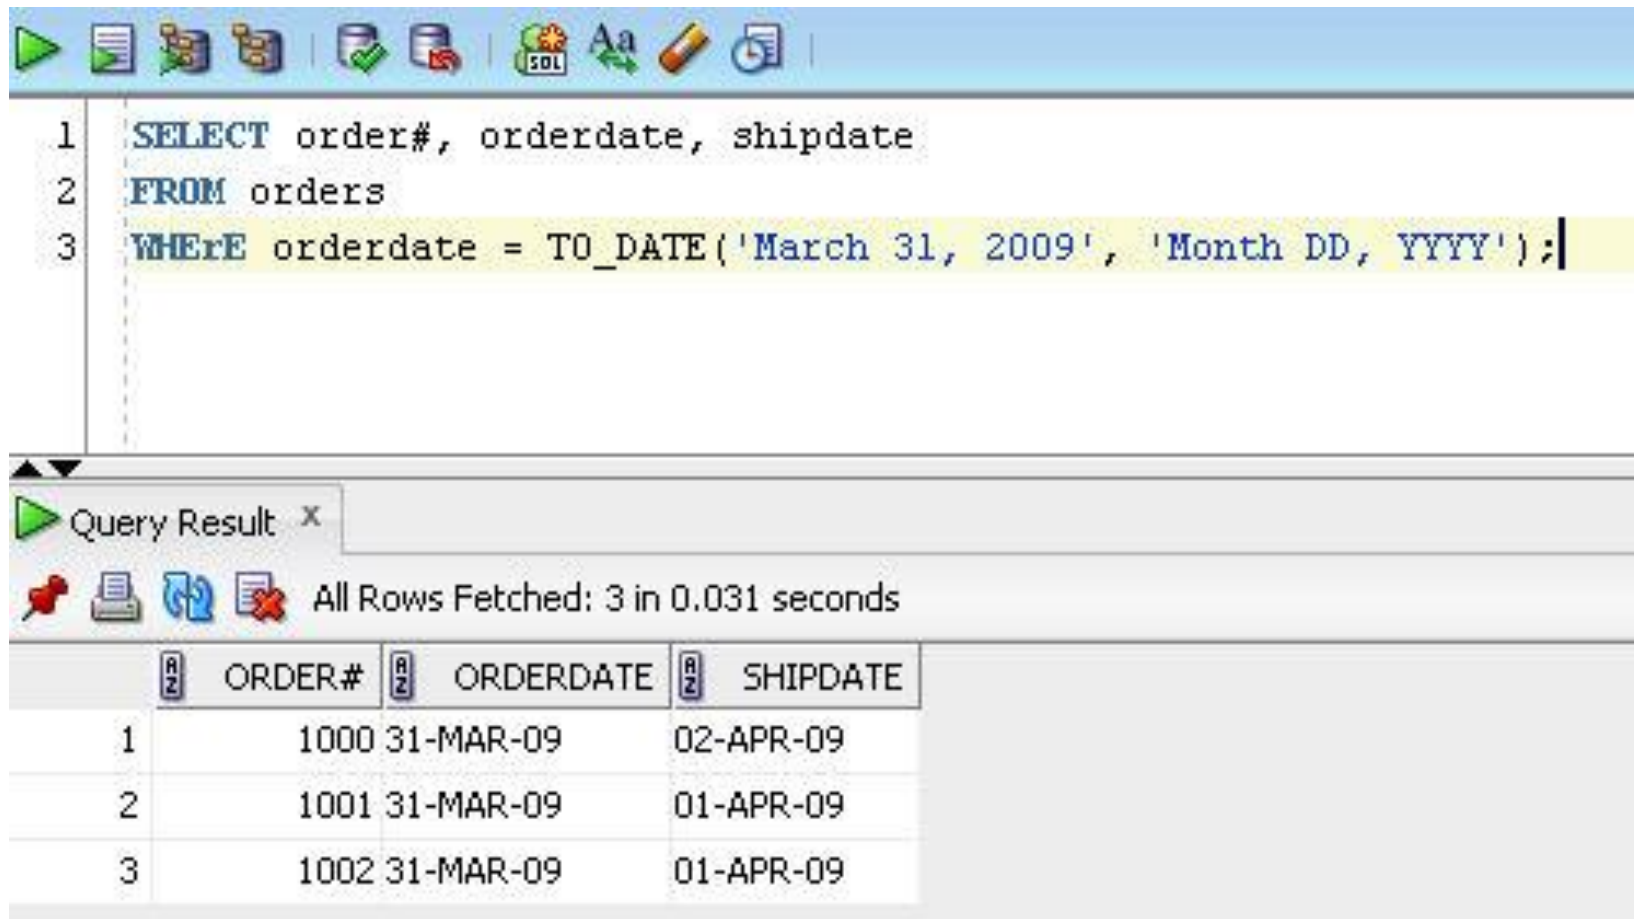

DATE FORMATS		
Element	Description	Example
MONTH	Name of the month spelled out—padded with blank spaces to a total width of nine spaces	APRIL
MON	Three-letter abbreviation for the name of the month	APR
MM	Two-digit numeric value of the month	04
RM	Roman numeral month	IV
D	Numeric value for the day of the week	Wednesday = 4
DD	Numeric value for the day of the month	28
DDD	Numeric value for the day of the year	December 31 = 365
DAY	Name of the day of the week—padded with blank spaces to a length of nine characters	Wednesday
DY	Three-letter abbreviation for the day of the week	WED
YYYY	Displays the Four-digit numeric value of the year	2004
YYY or YY or Y	The last three, two, or single digit(s) of the year	2004 = 004; 2004 = 04; 2004 = 4
YEAR	Spelled-out version of the year	TWO THOUSAND FOUR
B.C. or A.D.	Value indicating B.C. or A.D.	2004 A.D.

FIGURE 10-25 Data format elements

TO_DATE FUNCTION

- When working with the **TO_DATE** function, the user enters the **date** as the first argument and a **format mask** or model that allows Oracle to distinguish the date components entered
- Both the **date** and the **format** of the date are character strings so each argument is enclosed in *single quotes*
- In our example, the user will enter the date in the format of **MONTH, DD, YYYY**, this will be indicated in the format mask
- The **TO_DATE** function will be specified in the WHERE clause

TO_DATE FUNCTION

The screenshot displays a SQL IDE interface. The top toolbar includes icons for execution, saving, undo, redo, and formatting. The SQL editor contains the following query:

```
1 SELECT order#, orderdate, shipdate
2 FROM orders
3 WHERE orderdate = TO_DATE('March 31, 2009', 'Month DD, YYYY');|
```

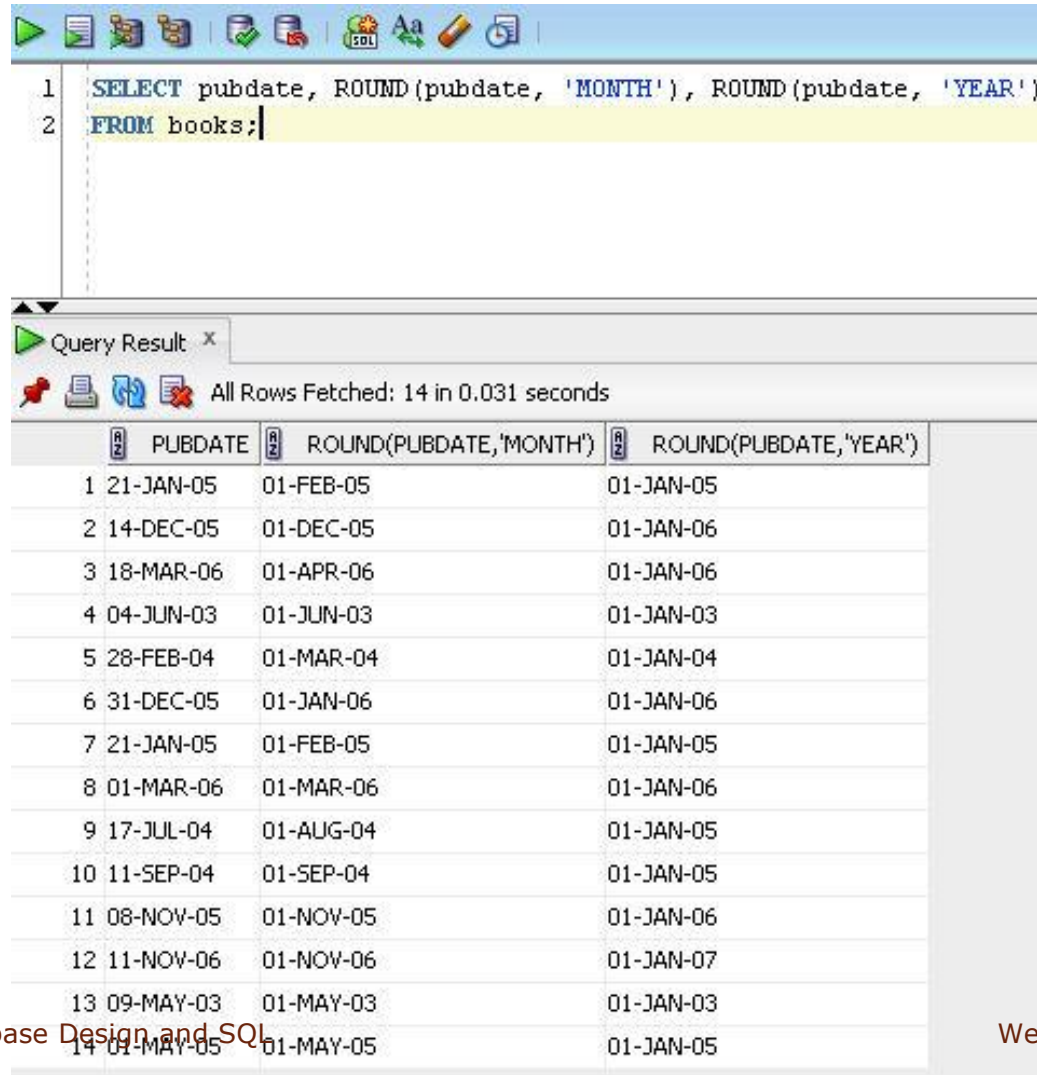

Below the editor, the 'Query Result' window shows the execution status: 'All Rows Fetched: 3 in 0.031 seconds'. The results are presented in a table with three columns: ORDER#, ORDERDATE, and SHIPDATE.

	ORDER#	ORDERDATE	SHIPDATE
1	1000	31-MAR-09	02-APR-09
2	1001	31-MAR-09	01-APR-09
3	1002	31-MAR-09	01-APR-09

ROUNDING DATE VALUES

- Even though the ROUND function is typically associated with numeric data you can use it on date values as well
- The syntax of the ROUND function is:
 - ROUND(d, u) where d is the date data and u represents the unit to use for rounding
- The date can be rounded by the unit month and year
- For month rounding if the day of the month is 16 or later, the date is rounded to the first of the next month
- If the day of the month is less than 16 the date is rounded to the first of that month
- Year rounding is similar with July 16th as the cutoff to determine rounding
- The 'YEAR' can also be represented as 'YYYY' and 'MONTH' can be represented as 'MM'

ROUNDING DATE VALUES

```
1 SELECT pubdate, ROUND(pubdate, 'MONTH'), ROUND(pubdate, 'YEAR')
2 FROM books;
```

Query Result x

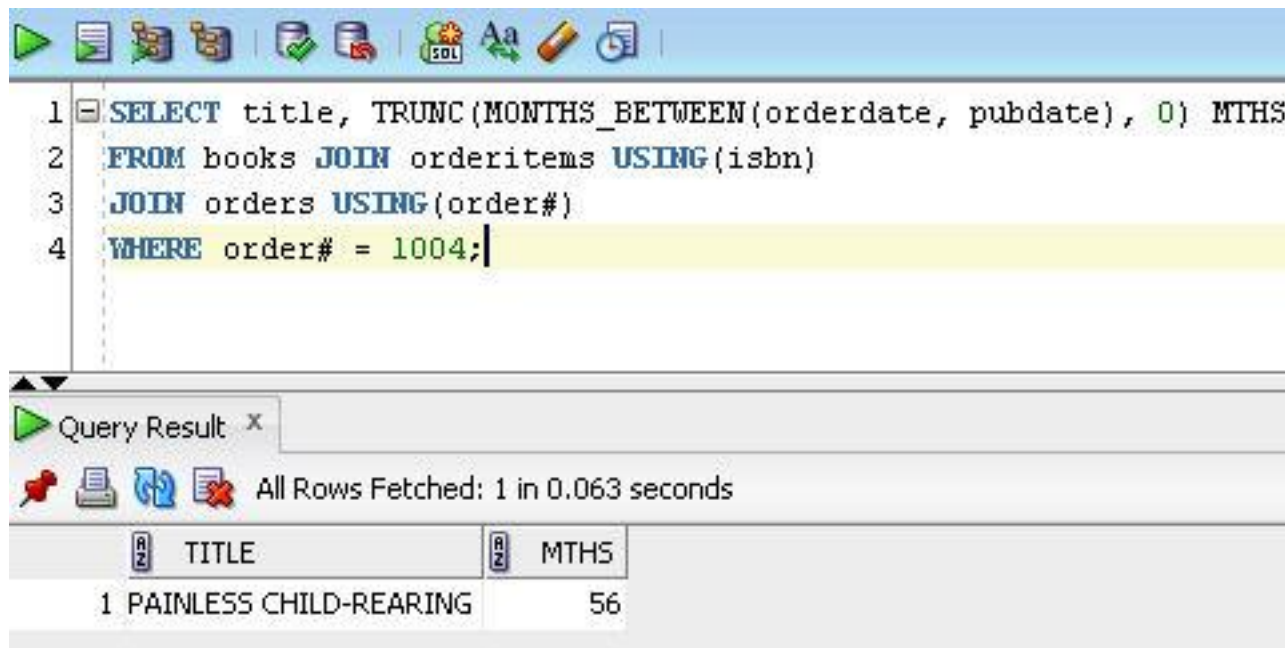

All Rows Fetched: 14 in 0.031 seconds

	PUBDATE	ROUND(PUBDATE,'MONTH')	ROUND(PUBDATE,'YEAR')
1	21-JAN-05	01-FEB-05	01-JAN-05
2	14-DEC-05	01-DEC-05	01-JAN-06
3	18-MAR-06	01-APR-06	01-JAN-06
4	04-JUN-03	01-JUN-03	01-JAN-03
5	28-FEB-04	01-MAR-04	01-JAN-04
6	31-DEC-05	01-JAN-06	01-JAN-06
7	21-JAN-05	01-FEB-05	01-JAN-05
8	01-MAR-06	01-MAR-06	01-JAN-06
9	17-JUL-04	01-AUG-04	01-JAN-05
10	11-SEP-04	01-SEP-04	01-JAN-05
11	08-NOV-05	01-NOV-05	01-JAN-06
12	11-NOV-06	01-NOV-06	01-JAN-07
13	09-MAY-03	01-MAY-03	01-JAN-03
14	01-MAY-05	01-MAY-05	01-JAN-05

TRUNCATING DATE VALUES

- The TRUNC function that is used for truncating numeric results can also be quite useful in date calculations and is applied to dates by using the unit of month or year
- The query shown has been used before on slide 67 where a large decimal portion was left
- To eliminate this decimal portion of the output s only the number of whole months is left the TRUNC function can be used
- The two functions being used together is an example of nesting functions, the value returned by the MONTHS_BETWEEN function is used as an argument for the TRUNC function, TRUNC is done so the entire decimal portion is removed and only the whole number of months remains

TRUNCATING DATE VALUES

The screenshot shows a SQL query editor window with a toolbar at the top. The query text is as follows:

```
1 SELECT title, TRUNC(MONTHS_BETWEEN(orderdate, pubdate), 0) MTHS
2 FROM books JOIN orderitems USING(isbn)
3 JOIN orders USING(order#)
4 WHERE order# = 1004;
```

Below the query editor is a 'Query Result' window. It displays the status 'All Rows Fetched: 1 in 0.063 seconds'. The results are shown in a table with two columns: 'TITLE' and 'MTHS'.

	TITLE	MTHS
1	PAINLESS CHILD-REARING	56

NESTING FUNCTIONS

- ⦿ Any single-row function can be nested inside other single-row functions
- ⦿ Nesting means that one function is used as an argument inside another function
- ⦿ There are some rules to follow:
 1. All arguments required for each function must be provided
 2. For every open parenthesis, there must be a corresponding close parenthesis
 3. The nested or inner function is solved first, the result of the inner function is passed to the outer function, and then the outer function is executed

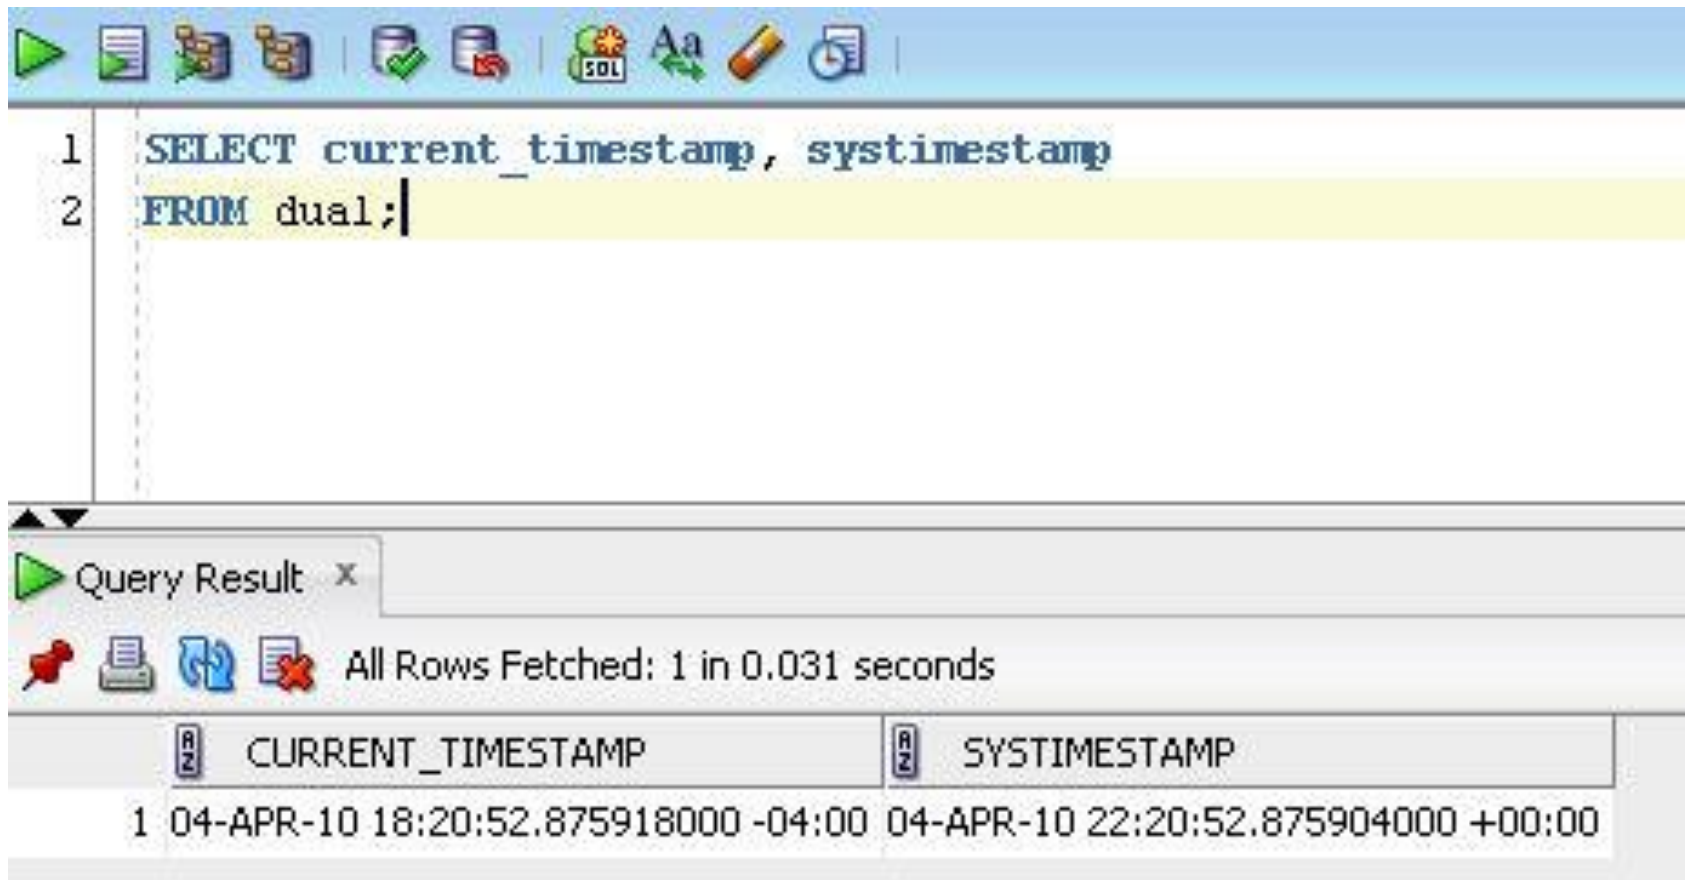

NESTING FUNCTIONS

- **TRUNC** function has *two arguments*, the value to be truncated and the position the truncation should occur
- The value to truncate is the result of the **MONTHS_BETWEEN** function
- This requires that the **MONTHS_BETWEEN** function be entered as the first argument of the **TRUNC** function
- The 0 indicates that there are to be no decimal places in the output after truncation occurs
- The value computed by the *inner function* is used to compute the *outer function*
- The result is a whole number

CURRENT_DATE VS. SYSDATE

- Many companies conduct transactions in different parts of the world so time zone recognition is essential
- Both CURRENT_DATE and SYSDATE functions identify the current date and time
- SYSDATE returns the current date and time set on the operating system where the database resides
- The CURRENT_DATE function returns the current date and time from the user session
- To demonstrate this our database is residing on Munro while SQL Developer is running locally on your computer
- Look at the output of the next slide, you will notice the two values are different, server is on GMT and the terminal is EST

CURRENT_DATE VS. SYSDATE

The screenshot shows an SQL IDE interface. The top toolbar contains various icons for file operations, execution, and formatting. The main text area displays a SQL query:

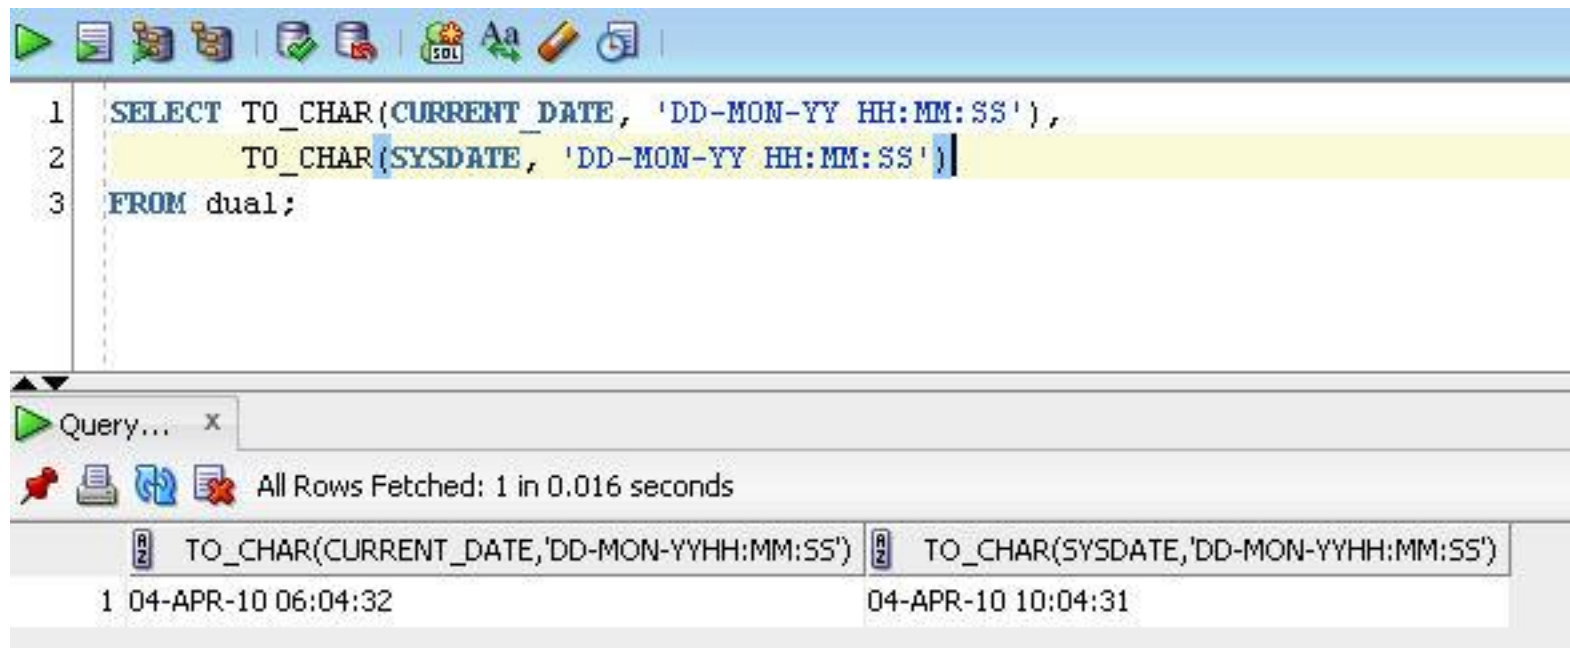

```
1 SELECT current_timestamp, systimestamp
2 FROM dual;
```

Below the query editor, the 'Query Result' pane shows the execution status: 'All Rows Fetched: 1 in 0.031 seconds'. The results are displayed in a table with two columns: 'CURRENT_TIMESTAMP' and 'SYSTIMESTAMP'.

	CURRENT_TIMESTAMP	SYSTIMESTAMP
1	04-APR-10 18:20:52.875918000 -04:00	04-APR-10 22:20:52.875904000 +00:00

CURRENT_DATE VS. SYSDATE

The time I entered this command was 6:04 PM, CURRENT_DATE reflects my computer's time, SYSDATE is Munro's time

```
1 SELECT TO_CHAR(CURRENT_DATE, 'DD-MON-YY HH:MM:SS'),
2        TO_CHAR(SYSDATE, 'DD-MON-YY HH:MM:SS')
3 FROM dual;
```

Query... x

All Rows Fetched: 1 in 0.016 seconds

TO_CHAR(CURRENT_DATE,'DD-MON-YYHH:MM:SS')	TO_CHAR(SYSDATE,'DD-MON-YYHH:MM:SS')
1 04-APR-10 06:04:32	04-APR-10 10:04:31

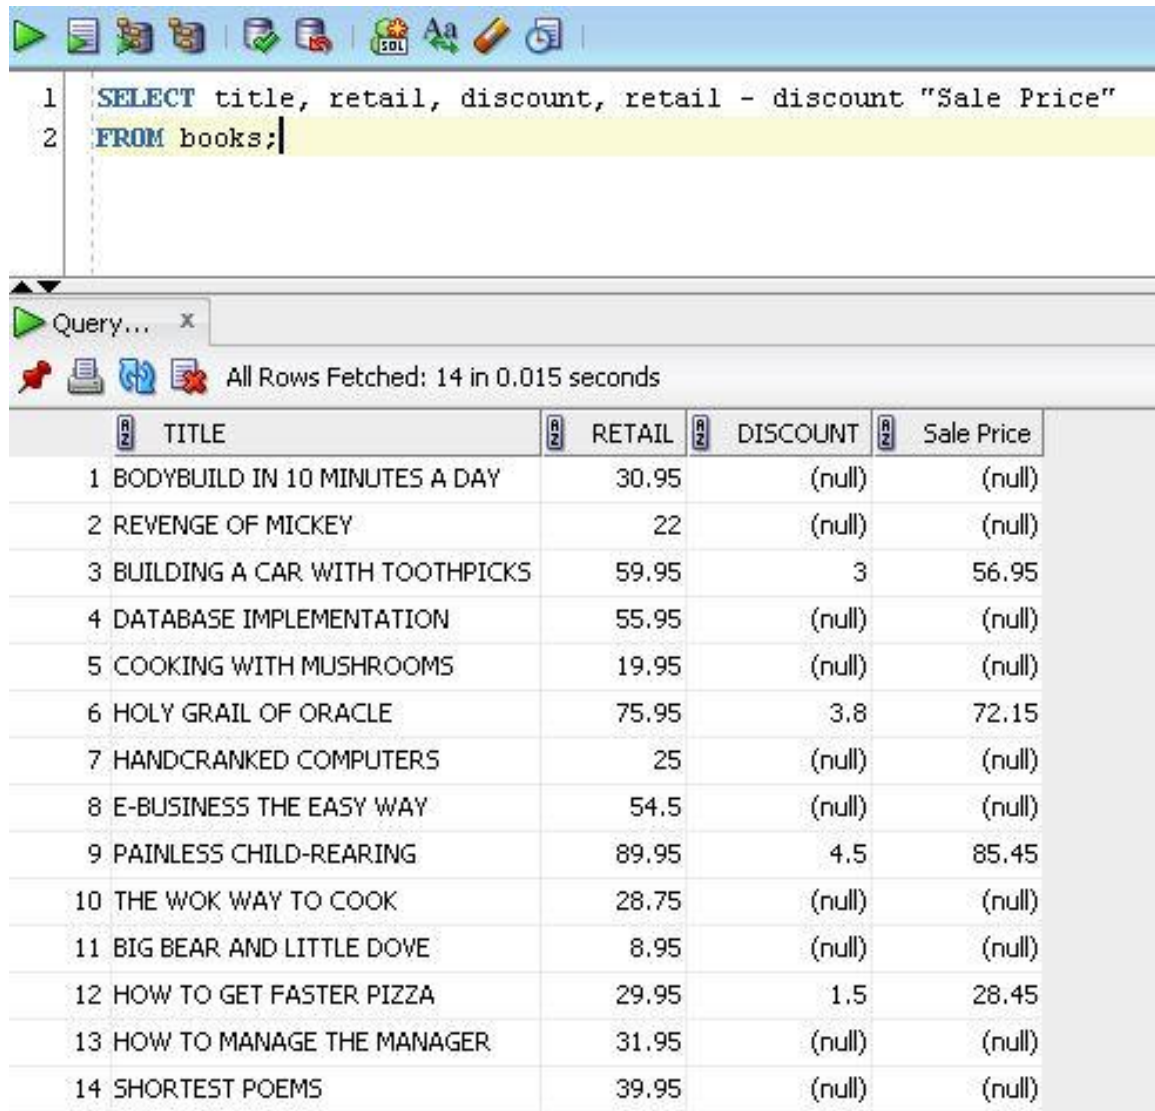

OTHER FUNCTIONS

- Some functions provided with Oracle 12c do not fall into character, numeric or date categories
- We will discuss five additional functions:
 - NVL
 - NVL2
 - TO_CHAR
 - DECODE
 - CASE

NVL FUNCTION

- The **NVL** function can be used to address problems that arise when performing arithmetic operations on numeric fields that contain **NULL** values
- As you recall, a **NULL** value is an absence of data or an unknown value
- If a **NULL** value is used in a calculation, the result is also a **NULL** value
- The **NVL** function allows you to substitute a value for an existing **NULL** value
- The syntax for **NVL** function is:
 - **NVL(x, y)**
 - Where **y** represents the value to be substituted if **x** is **NULL**
 - In many cases the substitute for a **NULL** value is 0

NVL FUNCTION

The screenshot shows a database query tool interface. At the top, there is a toolbar with various icons. Below it, a query editor shows the following SQL query:

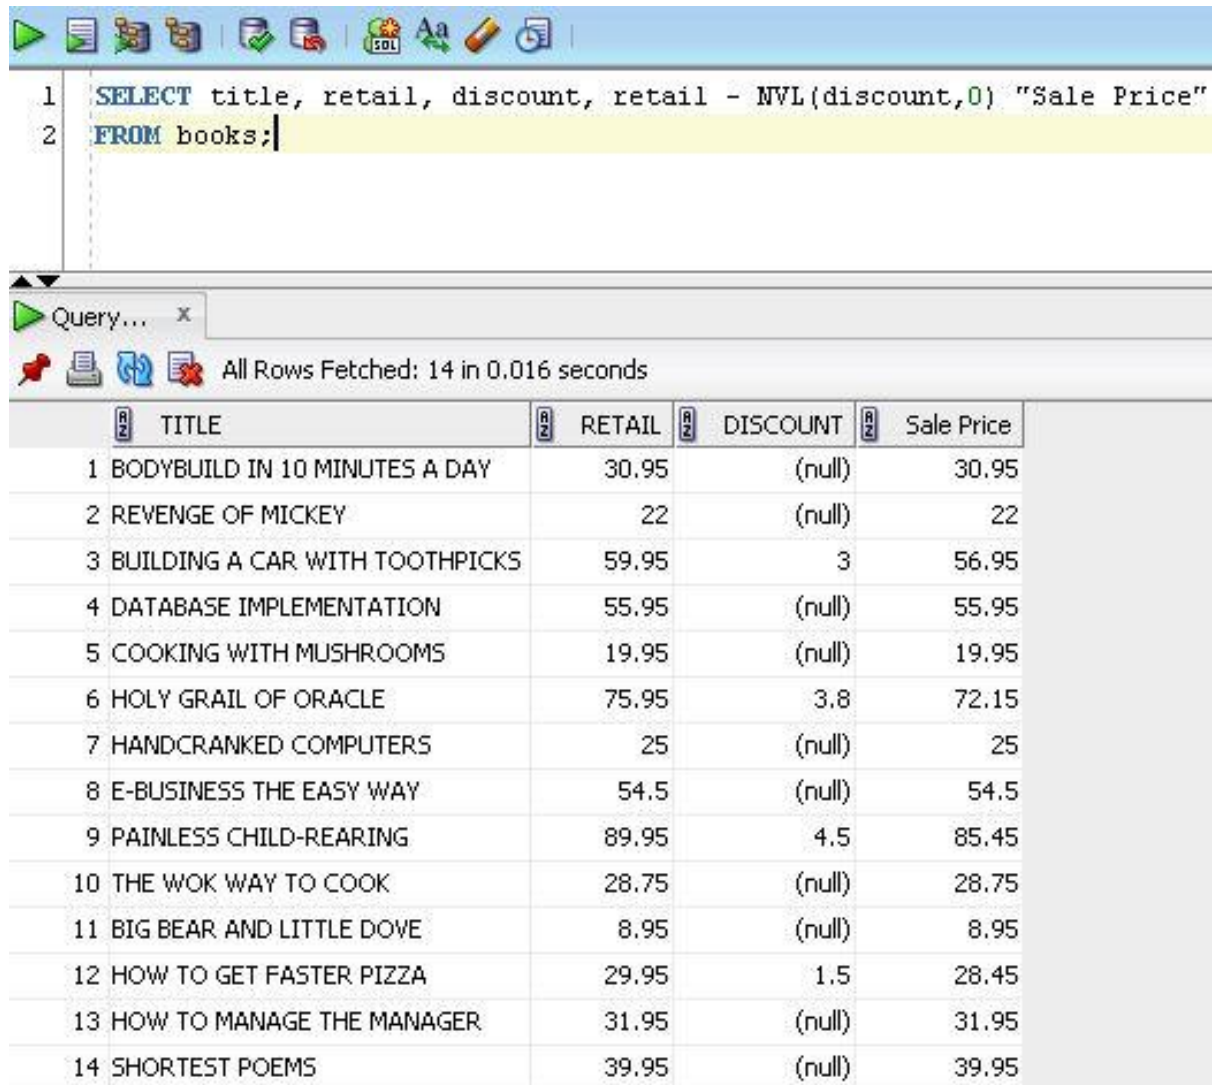

```
1 SELECT title, retail, discount, retail - discount "Sale Price"
2 FROM books;
```

Below the query editor, a status bar indicates "All Rows Fetched: 14 in 0.015 seconds". Below that, a table displays the results of the query. The table has four columns: TITLE, RETAIL, DISCOUNT, and Sale Price. The results are as follows:

	TITLE	RETAIL	DISCOUNT	Sale Price
1	BODYBUILD IN 10 MINUTES A DAY	30.95	(null)	(null)
2	REVENGE OF MICKEY	22	(null)	(null)
3	BUILDING A CAR WITH TOOTHPICKS	59.95	3	56.95
4	DATABASE IMPLEMENTATION	55.95	(null)	(null)
5	COOKING WITH MUSHROOMS	19.95	(null)	(null)
6	HOLY GRAIL OF ORACLE	75.95	3.8	72.15
7	HANDCRANKED COMPUTERS	25	(null)	(null)
8	E-BUSINESS THE EASY WAY	54.5	(null)	(null)
9	PAINLESS CHILD-REARING	89.95	4.5	85.45
10	THE WOK WAY TO COOK	28.75	(null)	(null)
11	BIG BEAR AND LITTLE DOVE	8.95	(null)	(null)
12	HOW TO GET FASTER PIZZA	29.95	1.5	28.45
13	HOW TO MANAGE THE MANAGER	31.95	(null)	(null)
14	SHORTEST POEMS	39.95	(null)	(null)

Notice that each book with a NULL discount value shows a null sales price as a result of the calculation

NVL FUNCTION

The screenshot shows a database query editor with a toolbar at the top. The query is as follows:

```
1 SELECT title, retail, discount, retail - NVL(discount,0) "Sale Price"
2 FROM books;
```

Below the query editor, a window titled "Query..." displays the results. It indicates "All Rows Fetched: 14 in 0.016 seconds". The results are presented in a table with the following columns: TITLE, RETAIL, DISCOUNT, and Sale Price.

	TITLE	RETAIL	DISCOUNT	Sale Price
1	BODYBUILD IN 10 MINUTES A DAY	30.95	(null)	30.95
2	REVENGE OF MICKEY	22	(null)	22
3	BUILDING A CAR WITH TOOTHPICKS	59.95	3	56.95
4	DATABASE IMPLEMENTATION	55.95	(null)	55.95
5	COOKING WITH MUSHROOMS	19.95	(null)	19.95
6	HOLY GRAIL OF ORACLE	75.95	3.8	72.15
7	HANDCRANKED COMPUTERS	25	(null)	25
8	E-BUSINESS THE EASY WAY	54.5	(null)	54.5
9	PAINLESS CHILD-REARING	89.95	4.5	85.45
10	THE WOK WAY TO COOK	28.75	(null)	28.75
11	BIG BEAR AND LITTLE DOVE	8.95	(null)	8.95
12	HOW TO GET FASTER PIZZA	29.95	1.5	28.45
13	HOW TO MANAGE THE MANAGER	31.95	(null)	31.95
14	SHORTEST POEMS	39.95	(null)	39.95

If the discount value is now a 0 (zero) the NVL function converts to a 0 then does the calculation

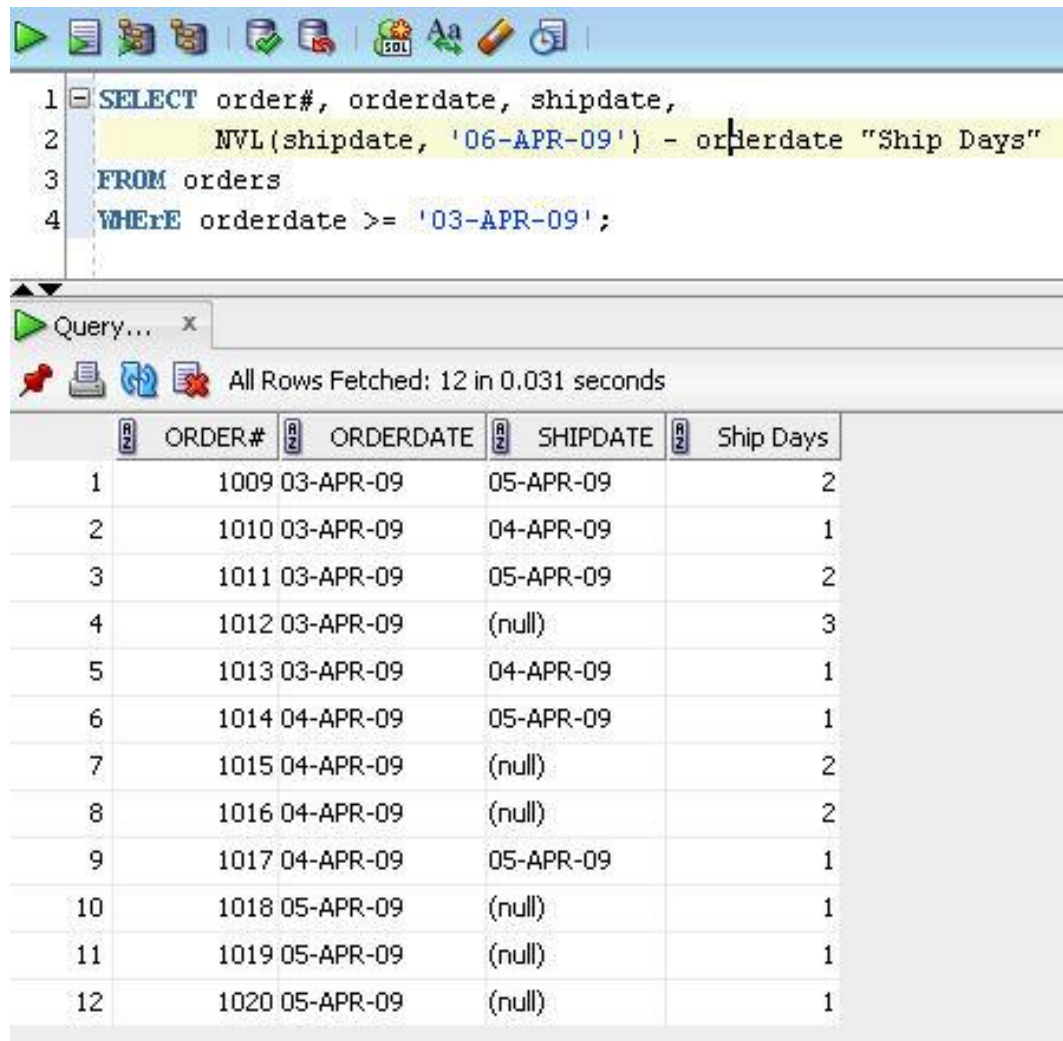

The result is a value for the Sale Price

For every NULL discount price it is made into a 0 for the calculation, the actual data is not modified

NVL FUNCTION

- Another example to demonstrate the use of the **NVL** function is to look at the orders table for Just Lee Books
- Some orders have not been shipped, so the value of shipdate is **NULL**
- Since every order is to be shipped on the following Monday, the **NVL** function could be used to substitute Monday's date so a value will appear for all records

NVL FUNCTION

```
1 SELECT order#, orderdate, shipdate,  
2     NVL(shipdate, '06-APR-09') - orderdate "Ship Days"  
3 FROM orders  
4 WHERE orderdate >= '03-APR-09';
```

Query... x
All Rows Fetched: 12 in 0.031 seconds

	ORDER#	ORDERDATE	SHIPDATE	Ship Days
1	1009	03-APR-09	05-APR-09	2
2	1010	03-APR-09	04-APR-09	1
3	1011	03-APR-09	05-APR-09	2
4	1012	03-APR-09	(null)	3
5	1013	03-APR-09	04-APR-09	1
6	1014	04-APR-09	05-APR-09	1
7	1015	04-APR-09	(null)	2
8	1016	04-APR-09	(null)	2
9	1017	04-APR-09	05-APR-09	1
10	1018	05-APR-09	(null)	1
11	1019	05-APR-09	(null)	1
12	1020	05-APR-09	(null)	1

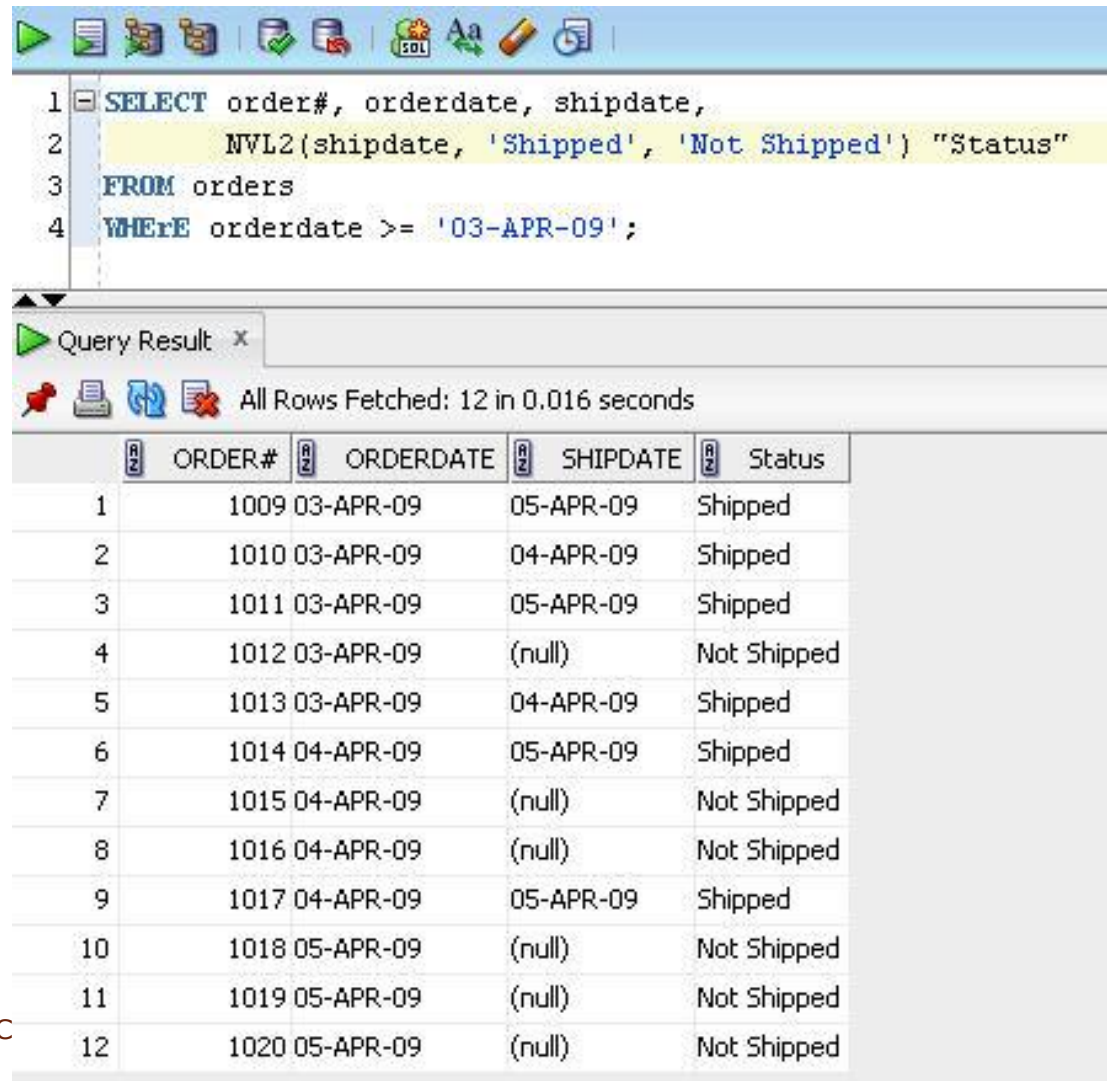

Since the shipdate for some orders is a NULL value, the delay value is also NULL

The anticipated ship date is now included using the NVL function, so a value for Delay appears for each record

NVL2 FUNCTION

- The **NVL2** function is a variation of the **NVL** function that allows different options based on whether a **NULL** value exists
- The syntax of the **NVL2** function is:
 - **NVL2(x, y, z)**
 - Where **y** represents what should be substituted if **x** is not **NULL** and **z** represents what should be substituted if **x** is **NULL**
 - This allows the user a little more flexibility when working with **NULL** values

NVL2 FUNCTION

```
1 SELECT order#, orderdate, shipdate,  
2     NVL2(shipdate, 'Shipped', 'Not Shipped') "Status"  
3 FROM orders  
4 WHERE orderdate >= '03-APR-09';
```

Query Result x

All Rows Fetched: 12 in 0.016 seconds

	ORDER#	ORDERDATE	SHIPDATE	Status
1	1009	03-APR-09	05-APR-09	Shipped
2	1010	03-APR-09	04-APR-09	Shipped
3	1011	03-APR-09	05-APR-09	Shipped
4	1012	03-APR-09	(null)	Not Shipped
5	1013	03-APR-09	04-APR-09	Shipped
6	1014	04-APR-09	05-APR-09	Shipped
7	1015	04-APR-09	(null)	Not Shipped
8	1016	04-APR-09	(null)	Not Shipped
9	1017	04-APR-09	05-APR-09	Shipped
10	1018	05-APR-09	(null)	Not Shipped
11	1019	05-APR-09	(null)	Not Shipped
12	1020	05-APR-09	(null)	Not Shipped

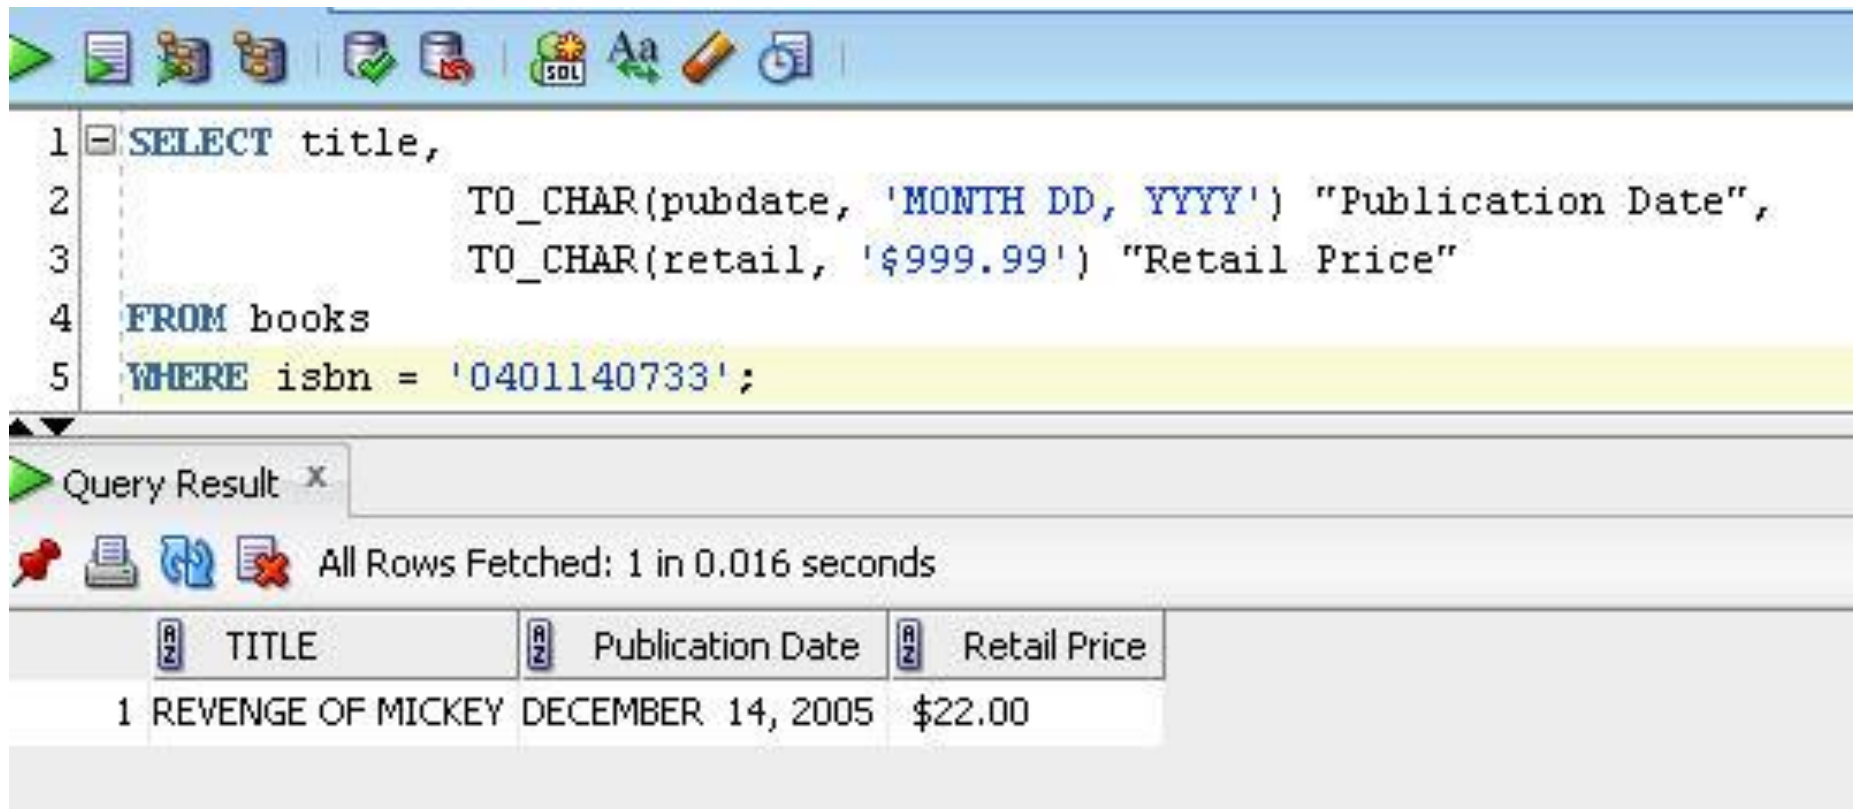

If the
SHIPDATE is
not null,
display
Shipped

If the
SHIPDATE is
a null value,
display the
string Not
Shipped

TO_CHAR FUNCTION

- The **TO_CHAR** function is widely used to convert dates and numbers to a formatted character string
- It is the opposite of the **TO_DATE** function
- The **TO_DATE** function allows a user to enter a date in any type of format, whereas the **TO_CHAR** function is used to have Oracle 12c display dates in a particular format
- The syntax of the **TO_CHAR** function is:
 - **TO_CHAR(n, 'f')**
 - Where **n** represents the date or number to be formatted and **f** represents the *format mask* or model to be used
 - The *format mask* consists of a series of elements that represent how the date should appear when displayed

TO_CHAR FUNCTION

The screenshot shows a SQL query editor with a toolbar at the top. The query is as follows:

```
1 SELECT title,  
2         TO_CHAR(pubdate, 'MONTH DD, YYYY') "Publication Date",  
3         TO_CHAR(etail, '$999.99') "Retail Price"  
4 FROM books  
5 WHERE isbn = '0401140733';
```

Below the query editor, the "Query Result" tab is active, showing "All Rows Fetched: 1 in 0.016 seconds". The results are displayed in a table with three columns: TITLE, Publication Date, and Retail Price.

TITLE	Publication Date	Retail Price
1 REVENGE OF MICKEY	DECEMBER 14, 2005	\$22.00

FORMATS		
Element	Description	Example
Date Elements		
MONTH	Name of the month spelled out—padded with blank spaces to a total width of nine spaces	APRIL
MON	Three-letter abbreviation for the name of the month	APR
MM	Two-digit numeric value of the month	04
RM	Roman numeral month	IV
D	Numeric value for the day of the week	Wednesday = 4
DD	Numeric value for the day of the month	28
DDD	Numeric value for the day of the year	December 31 = 365
DAY	Name of the day of the week—padded with blank spaces to a length of nine characters	Wednesday
DY	Three-letter abbreviation for the day of the week	WED
YYYY	Numeric value for the four-digit year	2004
YYY or YY or Y	Numeric value for the last three, two, or single digit(s) of year	2004 = 004; 2004=04; the 2004 = 4
YEAR	Spelled-out version of the year	TWO THOUSAND FOUR
BC or AD	Value indicating B.C. or A.D.	2004 A.D.
Time Elements		
SS	Seconds	Value between 0–59
SSSS	Seconds past midnight	Value between 0–86399
MI	Minutes	Value between 0–59
HH or HH12	Hours	Value between 1–12
HH24	Hours	Value between 0–23
A.M. or P.M.	Value indicating morning or evening hours	A.M. (before noon) or P.M. (after noon)
Number Elements		
9	Indicates width of display with a series of 9s, but insignificant leading zeros are not displayed	99999
0	Displays insignificant leading zeros	0009999
\$	Displays a floating dollar sign	\$99999
.	Indicates number of decimals to display	999.99
,	Displays a comma in the position indicated	9,999

FIGURE 10-38 Format model elements

TO_CHAR FUNCTION

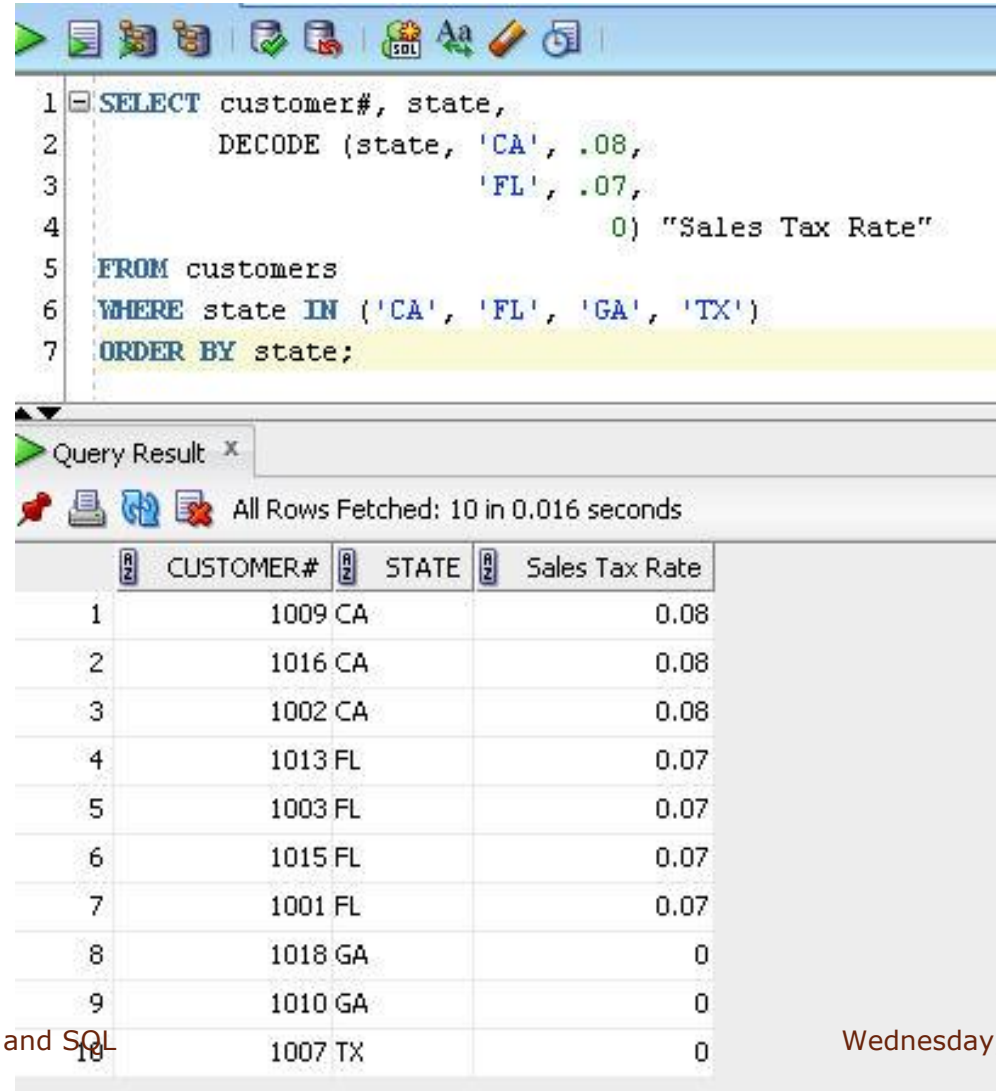

FORMATS		
Element	Description	Example
Other Elements		
, . (punctuation symbols)	Displays indicated punctuation	DD, YYYY = 24, 2001
“string”	Displays the exact character string inside the double quotation marks	“of the year” YYYY = of the year 2001
TH	Displays the ordinal number	DDTH = 8th
SP	Spells out the number	DDSP = EIGHT
SPTH	Spell out the ordinal number	DDSPTH = EIGHTH

FIGURE 10-38 Format model elements (continued)

DECODE FUNCTION

- The DECODE function takes a specified value and compares it to values in a list
- If a match is found the specified result is returned
- The DECODE function enables you to specify different actions to take depending on the circumstances
- It saves you from having to enter multiple statements for each possible situation
- The syntax of the DECODE is:
 - `DECODE(V, L1, R1, L2, R2, ... D)`
 - Where V is the value you are searching for
 - L1 represents the first value in the list
 - R1 represents the result to return if L1 and V are equivalent
 - D is the default value to return if no match is found

DECODE FUNCTION

```
1 SELECT customer#, state,  
2        DECODE (state, 'CA', .08,  
3                  'FL', .07,  
4                  0) "Sales Tax Rate"  
5 FROM customers  
6 WHERE state IN ('CA', 'FL', 'GA', 'TX')  
7 ORDER BY state;
```

Query Result x

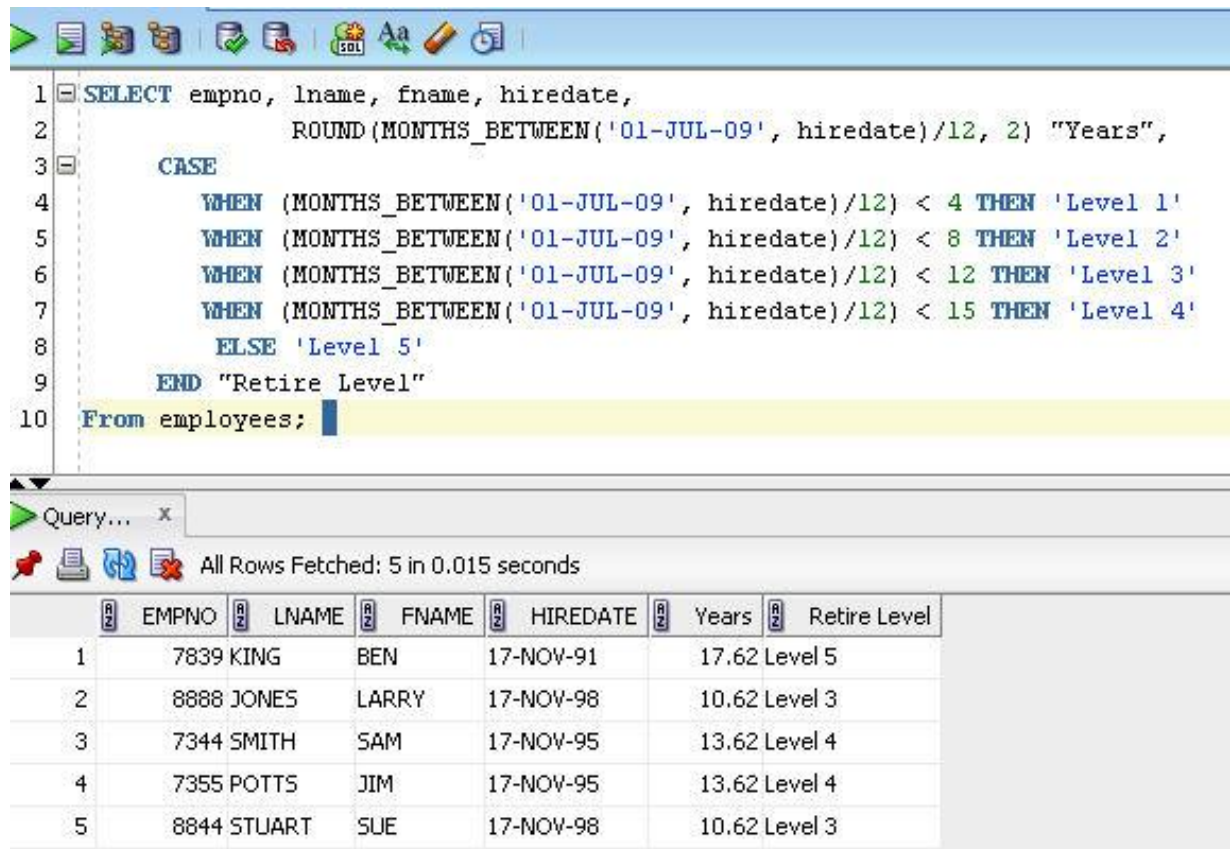

All Rows Fetched: 10 in 0.016 seconds

	CUSTOMER#	STATE	Sales Tax Rate
1	1009	CA	0.08
2	1016	CA	0.08
3	1002	CA	0.08
4	1013	FL	0.07
5	1003	FL	0.07
6	1015	FL	0.07
7	1001	FL	0.07
8	1018	GA	0
9	1010	GA	0
10	1007	TX	0

CASE EXPRESSION

- The CASE expression is similar to the DECODE function in that it can perform IF ... THEN ... ELSE conditional processing
- Both the simple CASE expression and the DECODE function evaluate equality conditions
- However the searched CASE expression gives you more flexibility because it allows other comparisons besides equality
- You might need to determine the retirement level assigned to employees based on the number of years employed at Just Lee Books
- These levels are determined using ranges of years

CASE EXPRESSION

The screenshot shows an SQL IDE with a query editor and a results pane. The query in the editor is as follows:

```
1 SELECT empno, lname, fname, hiredate,  
2        ROUND(MONTHS_BETWEEN('01-JUL-09', hiredate)/12, 2) "Years",  
3        CASE  
4            WHEN (MONTHS_BETWEEN('01-JUL-09', hiredate)/12) < 4 THEN 'Level 1'  
5            WHEN (MONTHS_BETWEEN('01-JUL-09', hiredate)/12) < 8 THEN 'Level 2'  
6            WHEN (MONTHS_BETWEEN('01-JUL-09', hiredate)/12) < 12 THEN 'Level 3'  
7            WHEN (MONTHS_BETWEEN('01-JUL-09', hiredate)/12) < 15 THEN 'Level 4'  
8            ELSE 'Level 5'  
9        END "Retire Level"  
10 FROM employees;
```

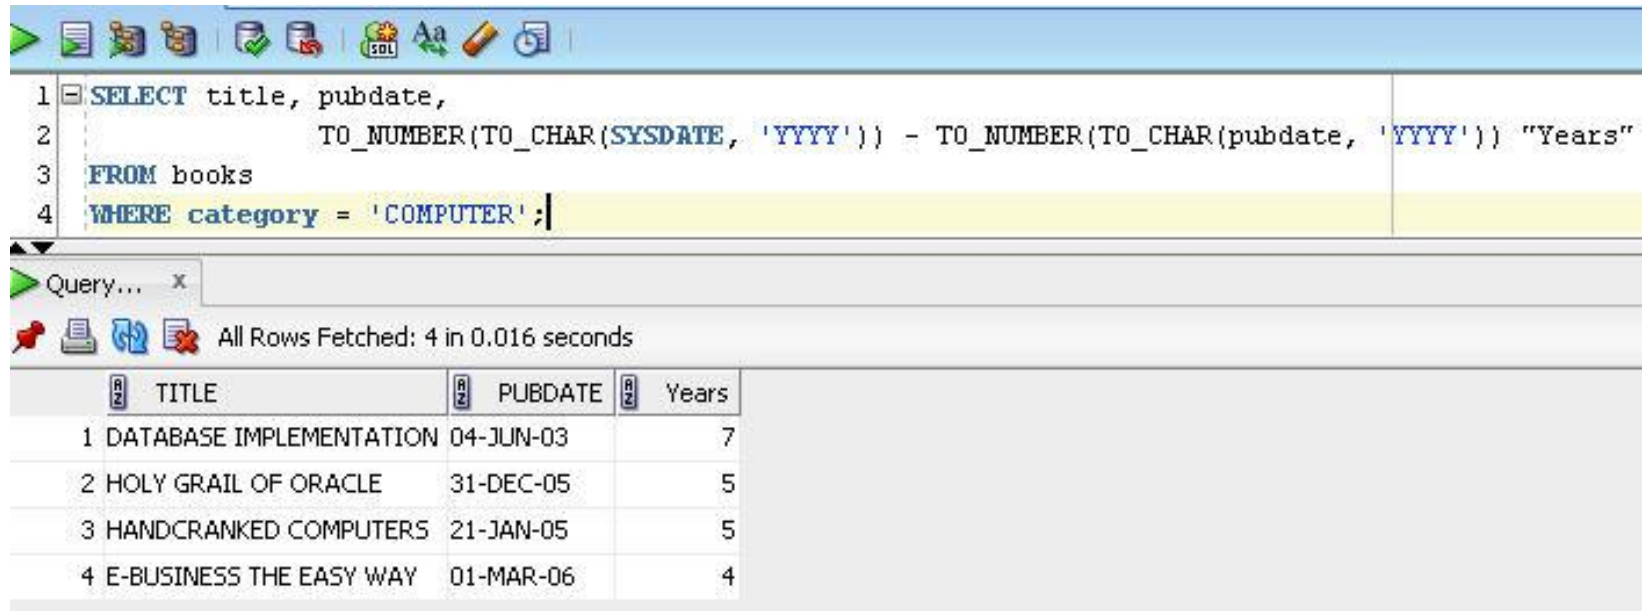

The results pane shows the output of the query, with 5 rows fetched in 0.015 seconds. The results are displayed in a table with the following columns: EMPNO, LNAME, FNAME, HIREDATE, Years, and Retire Level.

	EMPNO	LNAME	FNAME	HIREDATE	Years	Retire Level
1	7839	KING	BEN	17-NOV-91	17.62	Level 5
2	8888	JONES	LARRY	17-NOV-98	10.62	Level 3
3	7344	SMITH	SAM	17-NOV-95	13.62	Level 4
4	7355	POTTS	JIM	17-NOV-95	13.62	Level 4
5	8844	STUART	SUE	17-NOV-98	10.62	Level 3

THE TO_NUMBER FUNCTION

- The TO_NUMBER function converts a value to a numeric datatype, if possible
- The string value of 2009 stored in a date or character string could be converted to a numeric datatype to use in calculation

THE TO_NUMBER FUNCTION

The screenshot shows an SQL IDE interface. The top toolbar contains icons for execution, saving, undo, redo, and formatting. The main text area contains the following SQL query:

```
1 SELECT title, pubdate,  
2         TO_NUMBER(TO_CHAR(SYSDATE, 'YYYY')) - TO_NUMBER(TO_CHAR(pubdate, 'YYYY')) "Years"  
3 FROM books  
4 WHERE category = 'COMPUTER';
```

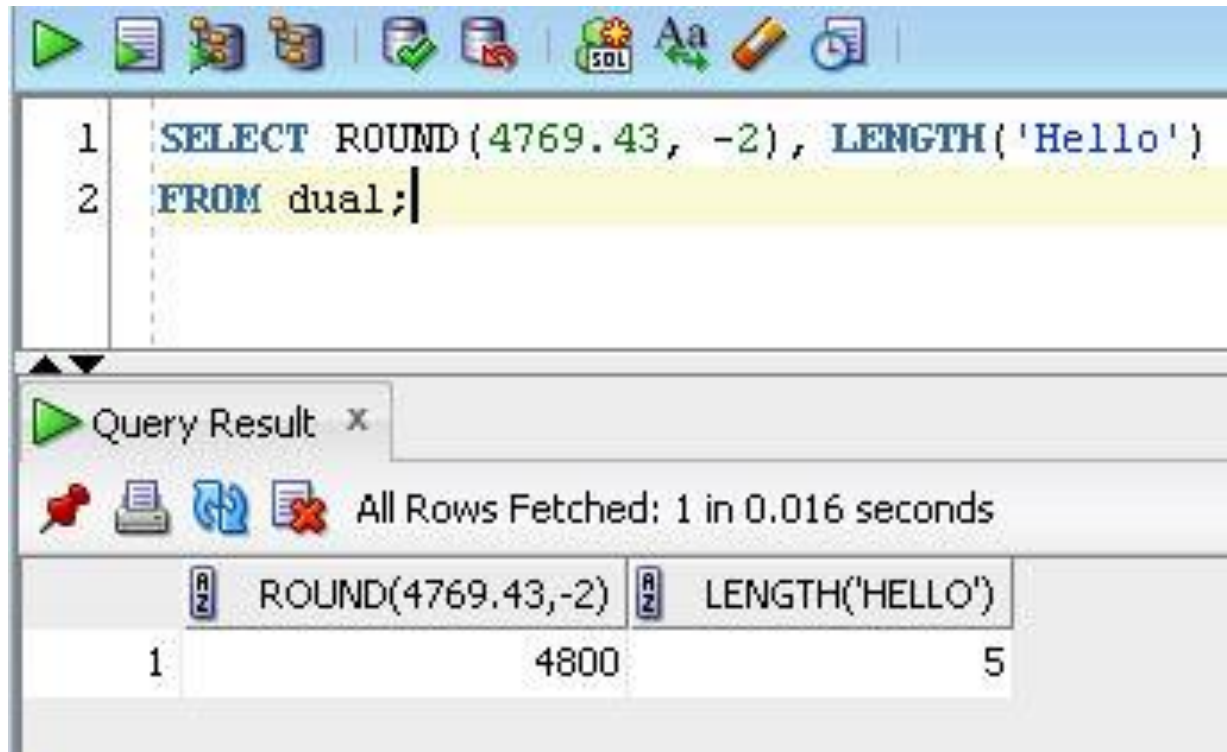

Below the query editor, a status bar indicates "All Rows Fetched: 4 in 0.016 seconds". The results are displayed in a table with three columns: TITLE, PUBDATE, and Years.

	TITLE	PUBDATE	Years
1	DATABASE IMPLEMENTATION	04-JUN-03	7
2	HOLY GRAIL OF ORACLE	31-DEC-05	5
3	HANDCRANKED COMPUTERS	21-JAN-05	5
4	E-BUSINESS THE EASY WAY	01-MAR-06	4

THE DUAL TABLE

- Any of the single-row functions covered in this chapter can be used with the DUAL table
- Although DUAL is rarely used in industry it can be valuable for someone learning how to work with functions or testing new function
- Oracle has the mandatory FROM clause to specify a table name in a query, DUAL can be that table

THE DUAL TABLE

The screenshot shows a SQL query editor with a toolbar at the top. The query is entered in two lines: `1 SELECT ROUND(4769.43, -2), LENGTH('Hello')` and `2 FROM dual;`. Below the editor is a 'Query Result' window. It has a toolbar with icons for pinning, printing, refreshing, and deleting. The text 'All Rows Fetched: 1 in 0.016 seconds' is displayed. The results are shown in a table with two columns: `ROUND(4769.43,-2)` and `LENGTH('HELLO')`. The first row contains the values 4800 and 5.

	ROUND(4769.43,-2)	LENGTH('HELLO')
1	4800	5
